Rymal Road (Upper James Street to Dartnall Road) Municipal Class EA
Multi-Modal Transportation Assessment

Dear Megan Salvucci,

Please find enclosed a copy of our Multi-Modal Transportation Assessment prepared as part of the Municipal Class Environmental Assessment of Rymal Road between Upper James Street and Dartnall Road.

Should you have any questions or wish to discuss our findings, please contact me at (416) 229 4647, extension 2376, or at mwalters@dillon.ca.

Sincerely,

DILLON CONSULTING LIMITED

Mike Walters, P.Eng.
Associate

1.0 Introduction

1.1 Purpose

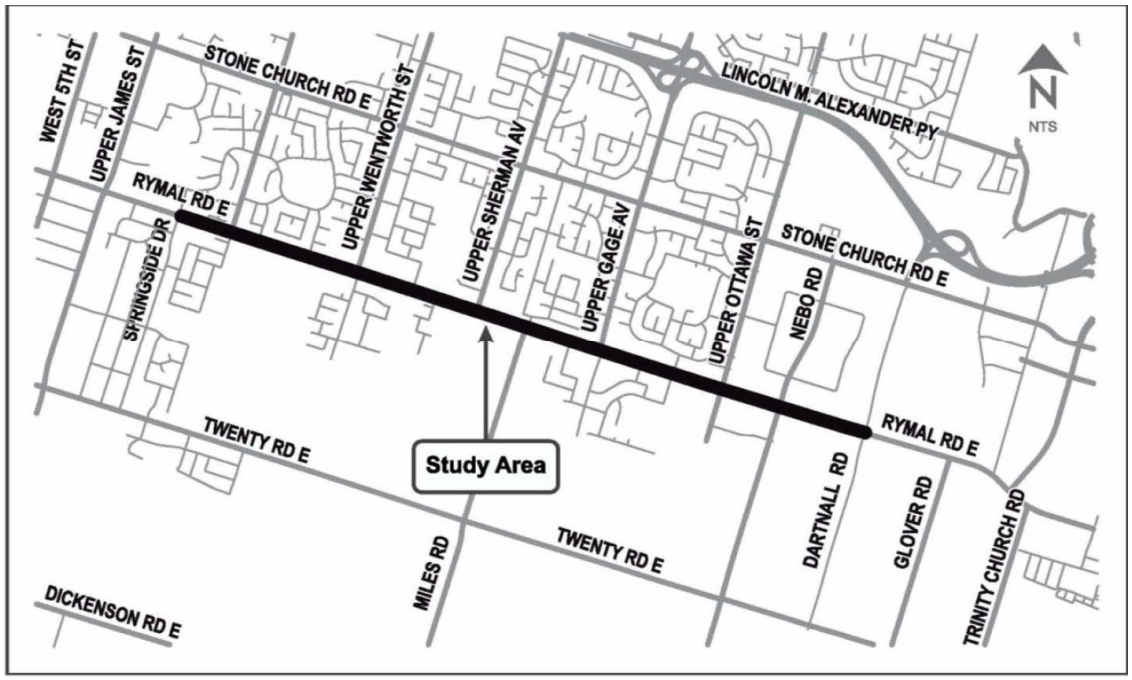
Dillon Consulting Limited (Dillon) has been retained by the City of Hamilton to undertake a Municipal Class Environmental Assessment (EA) of the Rymal Road corridor between Springside Avenue (east of Upper James Street) and Dartnall Road.

This report has been prepared to document existing roadway and multi-modal transportation conditions within the study area, including the recent collision history along the corridor; identify City policies and studies in place that may be applicable to the study area; estimate future traffic demand in the study area at a 2041 horizon; determine the ability of the existing road network to accommodate the projected 2041 traffic demand; identify roadway modifications that may be required to accommodate the projected traffic demand; and identify other gaps in multi-modal infrastructure within the corridor that may be addressed as part of any future roadway reconfiguration.

1.2 Study Area

The study area of the EA consists of a 5.2 kilometre section of the Rymal Road corridor from Upper James Street to Dartnall Road, including the area of influence of intersections along the corridor. There are 11 signalized intersections (including one intersection pedestrian signal) within the study area. Figure 1 illustrates the extents of the EA study area.

Figure 1: Study Area



1.3 Scope of Analysis

This report includes the following components:

- A review of existing transportation conditions within the study area:
  - Existing roadway geometry, active transportation infrastructure and transit service;
  - Typical existing traffic volumes;
  - Existing active transportation activity; and
  - Existing intersection traffic operations;
- A review of the collision history along the Rymal Road corridor over a five-year period (2015–19) and identification of patterns potentially related to the existing roadway configuration;
- An estimate of future automobile traffic demand within the corridor and an assessment of the ability of the existing roadway to accommodate this demand; and
- Identification of gaps in the active transportation network that may warrant consideration in the development of potential design alternatives.

Traffic analyses and forecasts have been prepared for the AM and PM peak hours of a typical weekday.

Existing volumes and analyses reflect 2019 conditions to avoid atypical traffic patterns due to the COVID-19 pandemic experienced during the majority of 2020. Future volumes and analyses have been prepared for a 2041 horizon

2.0 Existing Conditions

2.1 Existing Road Network

Rymal Road is a major arterial road and the southernmost east-west arterial road within the urban area of Hamilton, approximately 2 kilometres south of the Lincoln Alexander Parkway. Combined with Garner Road to the west and Hamilton Road 20 (former Highway 20) to the east, it forms a continuous major arterial road corridor between Wilson Street (former Highway 2) in Ancaster and the Region of Niagara boundary at Westbrook Road. It has a posted speed limit of 60 km/h.

Rymal Road has historically had a continuous two- to three-lane cross-section for the majority of its length, save for short five-lane sections near Upper James Street and near Upper Centennial Parkway. Sidewalks were present in some sections in the study area but were not continuous. Since 2015, parts of Rymal Road to the west and east of the study area have been widened to a five-lane cross-section (Upper Paradise Road to West 5th Street; Fletcher Road). Some sections within the study area have also been widened in conjunction with sidewalk construction. The study area continues to operate with one lane per direction (plus a two-way centre left turn lane and auxiliary right turn lanes at some intersections), with the additional lanes currently hatched out for use as paved shoulders.

North-south arterial roads intersect with Rymal Road approximately every 800 metres (half-mile) and extend north into the urban area of the city. Every other arterial roadway provides access to the Lincoln Alexander Parkway, while others cross over the parkway via a grade separation. The concession road network in the rural area south of Rymal Road is irregular and does not match the arterial grid to the north; in some cases, urban arterial roads continue to the south of Rymal Road; in others, they continue south as local roads but do not extend into the rural area; in one case (Miles Road), they are offset from urban arterials and result in a “jog” along Rymal Road for north-south traffic.

Numerous local streets and private accesses intersect with Rymal Road. Private accesses include major driveways to commercial plazas; private roadways serving townhouse complexes; lower-volume commercial driveways serving single-tenant commercial and industrial lots; and single-family residential driveways. The majority of accesses permit full movements. A continuous two-way left turn lane exists along the full extent of the corridor to serve left turns to local streets and private driveways.

Table 1 documents the characteristics of major intersecting north-south roadways within the study area.

Table 1: Characteristics of Major Intersecting Streets

Location	North/South of Rymal	Classification	Lanes/ direction	Sidewalks	Bicycle lanes	Speed limit (km/h)
Upper James Street	Both sides	Major arterial	2	Both sides	No	50
Upper Wellington Street	North side	Minor arterial	1	Both sides	Yes	50*
	South side	Collector	1	Both sides	No	40
Upper Wentworth Street	North side	Minor arterial	2	Both sides	No	50*
	South side	Collector	1	Both sides	No	40
Upper Sherman Avenue	North side	Minor arterial	1	Both sides	Yes	50*
	South side	Collector	1	Both sides	Yes	50*
Miles Road	South side	Minor arterial	1	None	No	60
Upper Gage Avenue	North side	Minor arterial	1	Both sides	No	50
	South side	Collector	1	Both sides	No	50*
Upper Ottawa Street	North side	Minor arterial	2	Both sides	No	50*
	South side	Collector	1	None	No	50*
Nebo Road	North side	Collector	2	None	No	50*
	South side	Collector	1	None	No	60
Dartnall Road	North side	Major arterial	2	West side	No	50*
	South side	Minor arterial	2	East side	No	60

*No speed limit is posted; 50 km/h statutory speed limit applies

The following north-south roadways connect to the Lincoln Alexander Parkway, 2 kilometres north of Rymal Road:

- Upper James Street
- Upper Wentworth Street
- Upper Gage Avenue
- Dartnall Road

Traffic signals are installed at the following intersections with Rymal Road (from west to east):

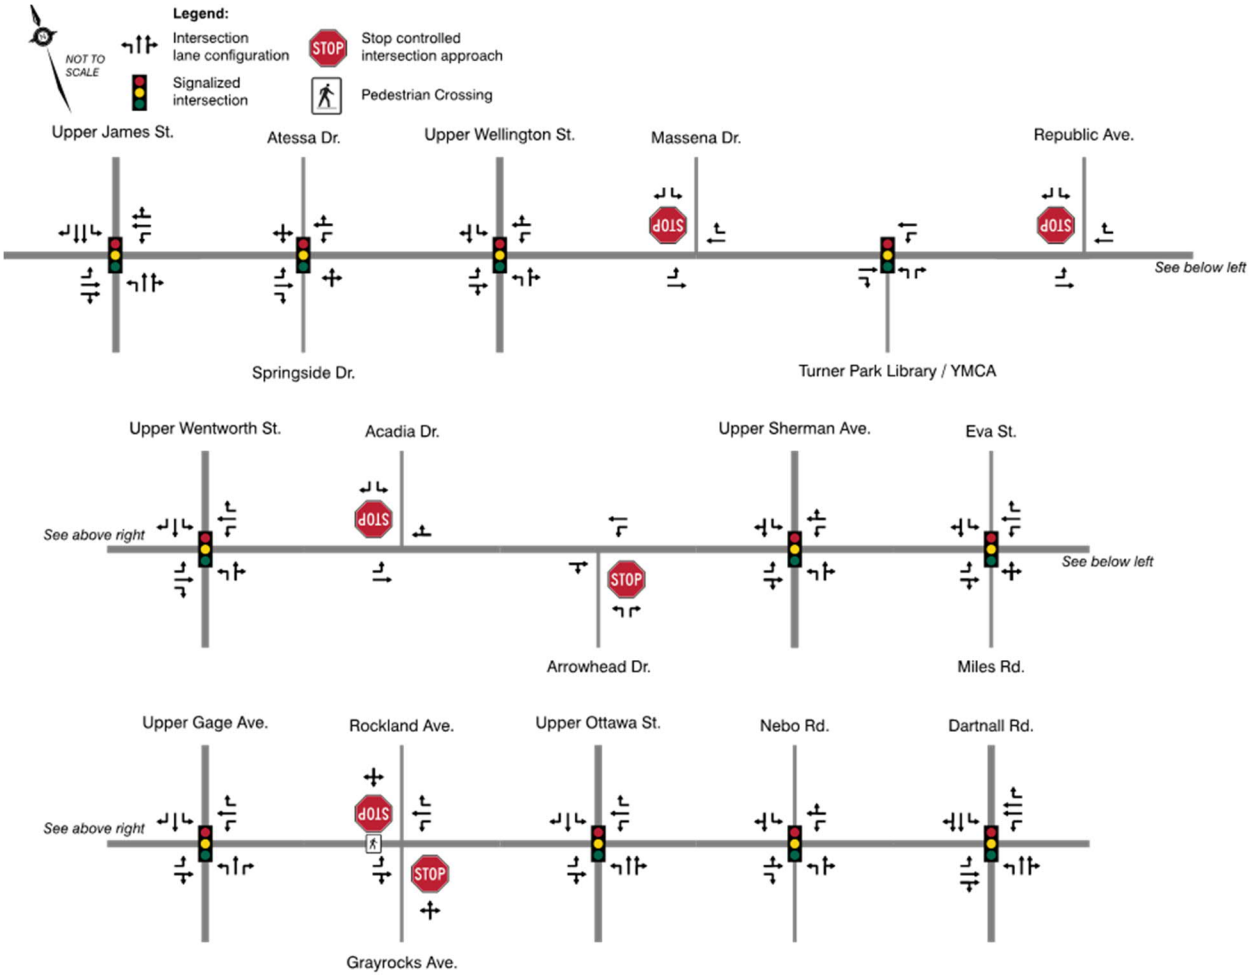
- Upper James Street
- Springside Avenue / Atessa Drive
- Upper Wellington Street
- Turner Park Library / YMCA Entrance
- Upper Wentworth Street
- Upper Sherman Avenue

- Miles Road / Eva Street
- Upper Gage Avenue
- Rockland Avenue / Grayrocks Avenue (intersection pedestrian signal)
- Upper Ottawa Street
- Nebo Road
- Dartnall Road

In addition to the locations listed above, traffic signals were installed at Arrowhead Drive in May 2022. The existing conditions analyses are based on the unsignalized configuration that existed at the time of the traffic counts. Future conditions analyses reflect the subsequent installation of traffic signals.

Figure 2 shows the lane configuration and traffic control in the study area that existed as of the outset of this study.

Figure 2: Existing Intersection Geometry and Traffic Control



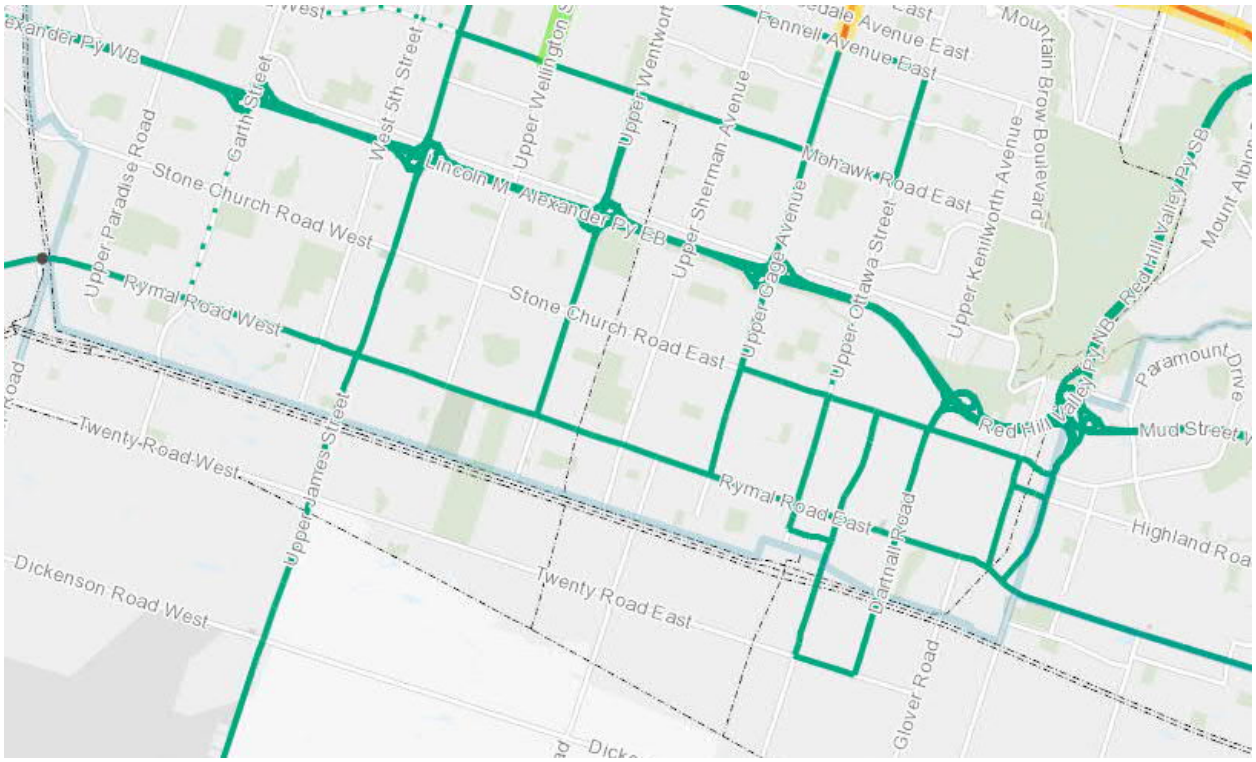
2.2 Truck Route Network

The entire Garner Road / Rymal Road corridor forms part of the City of Hamilton's truck route network (as shown in Figure 3) and is the only continuous east-west truck route south of the Lincoln Alexander Parkway.

The following other intersecting streets within the study area are also part of the designated truck route network:

- Upper James Street
- Upper Wentworth Street (north of Rymal Road)
- Upper Gage Avenue (north of Rymal Road)
- Upper Ottawa Street
- Nebo Road (as far south as Twenty Road East)
- Dartnall Road

Figure 3: Existing Truck Route Network



2.3 Existing Active Transportation Facilities

2.3.1 Sidewalks

Prior to 2016, the sidewalks along Rymal Road were discontinuous and had numerous gaps of significant length. Many of these gaps were filled by new sidewalks constructed in 2016 and 2017, and sidewalks now exist along both sides of Rymal Road between Upper James Street and Nebo Road, except as follows:

- A 100-metre gap on the north side, west of Atessa Drive;
- A 300-metre gap between Upper Sherman Avenue and Miles Road (south side); and
- A 125-metre gap on the south side, east of Upper Ottawa Street.

The position of the sidewalk within the roadway cross-section varies from location to location. In some locations, the sidewalk is positioned directly adjacent to the travel lanes; in some locations, it is positioned adjacent to the pavement but with an allowance for a paved shoulder to be converted to a second travel lane; in other locations, it is separated from the travel lanes by a grassed boulevard and/or gravel shoulder, with a setback of up to 11 metres.

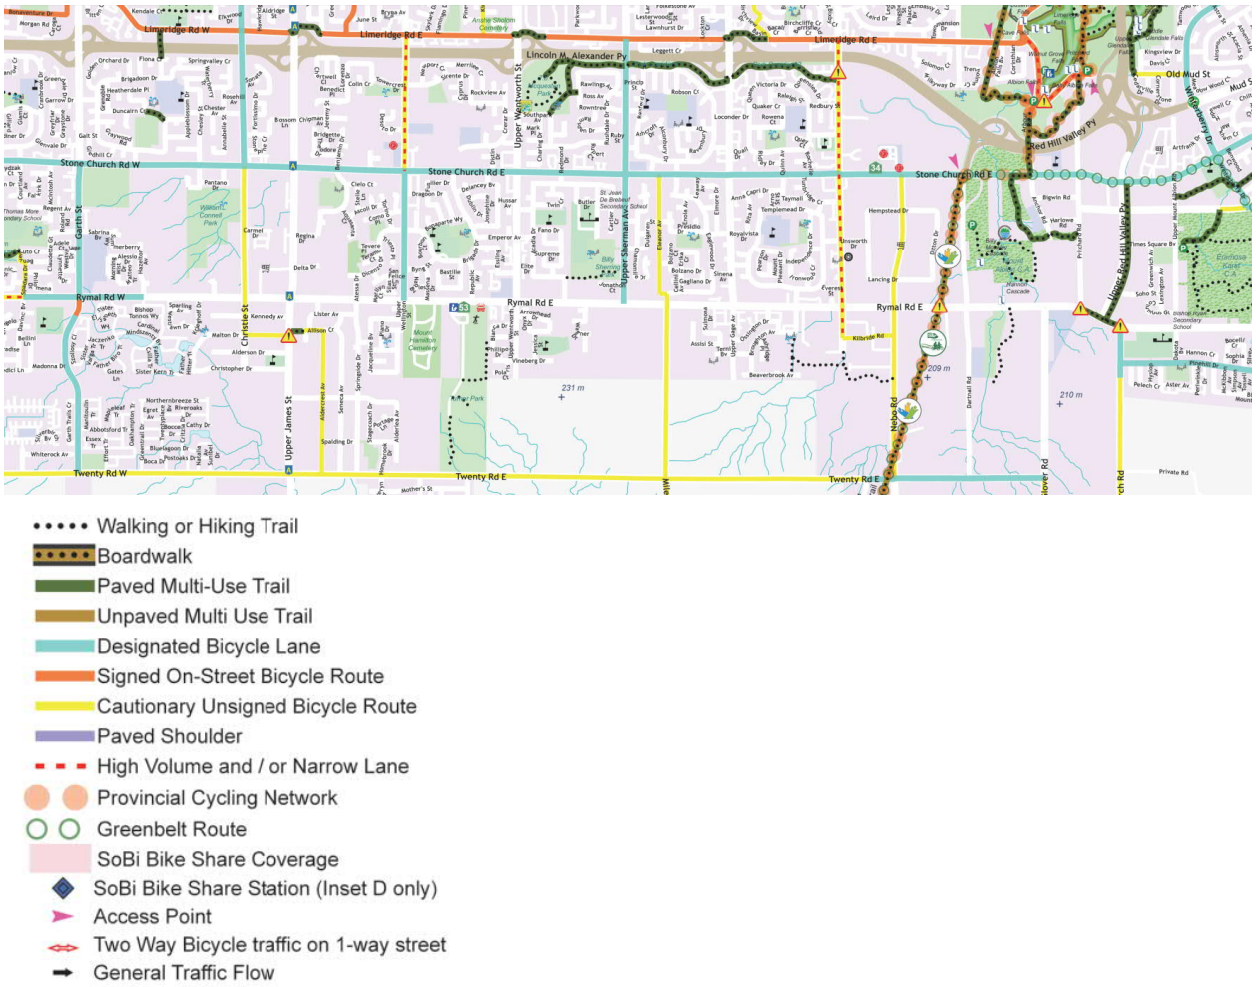
Between Nebo Road and Dartnall Road, Rymal Road has a predominantly rural cross-section without sidewalks, although sidewalks have recently been constructed in the vicinity of Dartnall Road (for approximately 50 metres on the north side, and approximately 185 metres on the south side).

East of Dartnall Road, sidewalks were constructed on both sides as part of road widening undertaken in 2015–2016.

2.3.2 Cycling Facilities

Figure 4 presents the existing cycling network in the study area. There are no dedicated cycling facilities along Rymal Road within the study area. There is a multi-use trail within the north boulevard for approximately 400-500 metres on either side of Garth Street; otherwise, there are no dedicated cycling facilities within the sections of Rymal Road that have been recently reconstructed west and east of the study area.

Figure 4: Existing Cycling Network in Study Area



Source: City of Hamilton Bikeways Map (Urban), 2020

The closest east-west cycling corridor is Stone Church Road, 1 kilometre to the north, which has on-street bicycle lanes along its full extents.

Dedicated bicycle lanes exist north of Rymal Road on Upper Wellington Street and Upper Sherman Avenue. The Chippewa Rail Trail intersects with Rymal Road between Nebo Road and Dartnall Road. East of the study area, a multi-use path exists along the north side of Rymal Road between Pritchard Road and Trinity Church Road.

Bicycle racks are provided on HSR buses, providing alternative travel means for cyclists to bridge gaps on busier roadways without cycling infrastructure.

2.4 Existing Transit Service

The Hamilton Street Railway (HSR) operates transit service along Rymal Road, as well as along other north-south roadways within the study area.

Route 44 (Rymal) operates along the full extent of Rymal Road throughout the study area. To the west, it continues along Rymal Road and Garner Road westerly to the Ancaster Business Park at Wilson Street. To the east, it extends along Rymal Road to Upper Centennial Parkway, where it turns to the north, crosses the escarpment, and continues along Centennial Parkway to Confederation Plaza south of the Queen Elizabeth Way. It operates every 15 minutes during the weekday peak periods and every 30 minutes at most other times.

Rymal Road forms the southern boundary of the transit service area; with the exception of routes traveling on Upper James Street, all north-south routes extend as far south as Rymal Road before looping to return north. Routes 23 and 24, and Routes 25 and 26, are interlined to operate in two-way loops (e.g., Route 24 travels south along Upper Sherman Avenue to Rymal Road, then turns to the east toward Upper Gage Avenue where it returns north as Route 23, and vice versa).

The route network in the study area is illustrated in Figure 5. Table 2 presents the typical headways (interval between buses) on Rymal Road and on intersecting north-south routes as of September 2023.

Figure 5: Existing HSR Route Network in Study Area

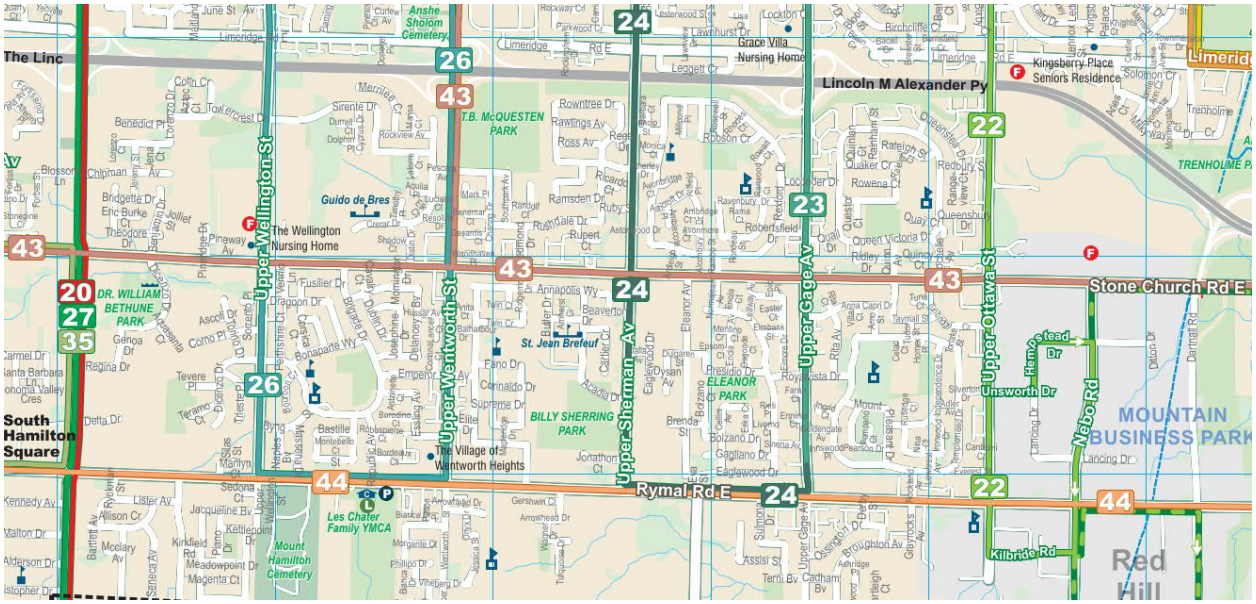


Table 2: Existing Transit Service Headways (September 2023)

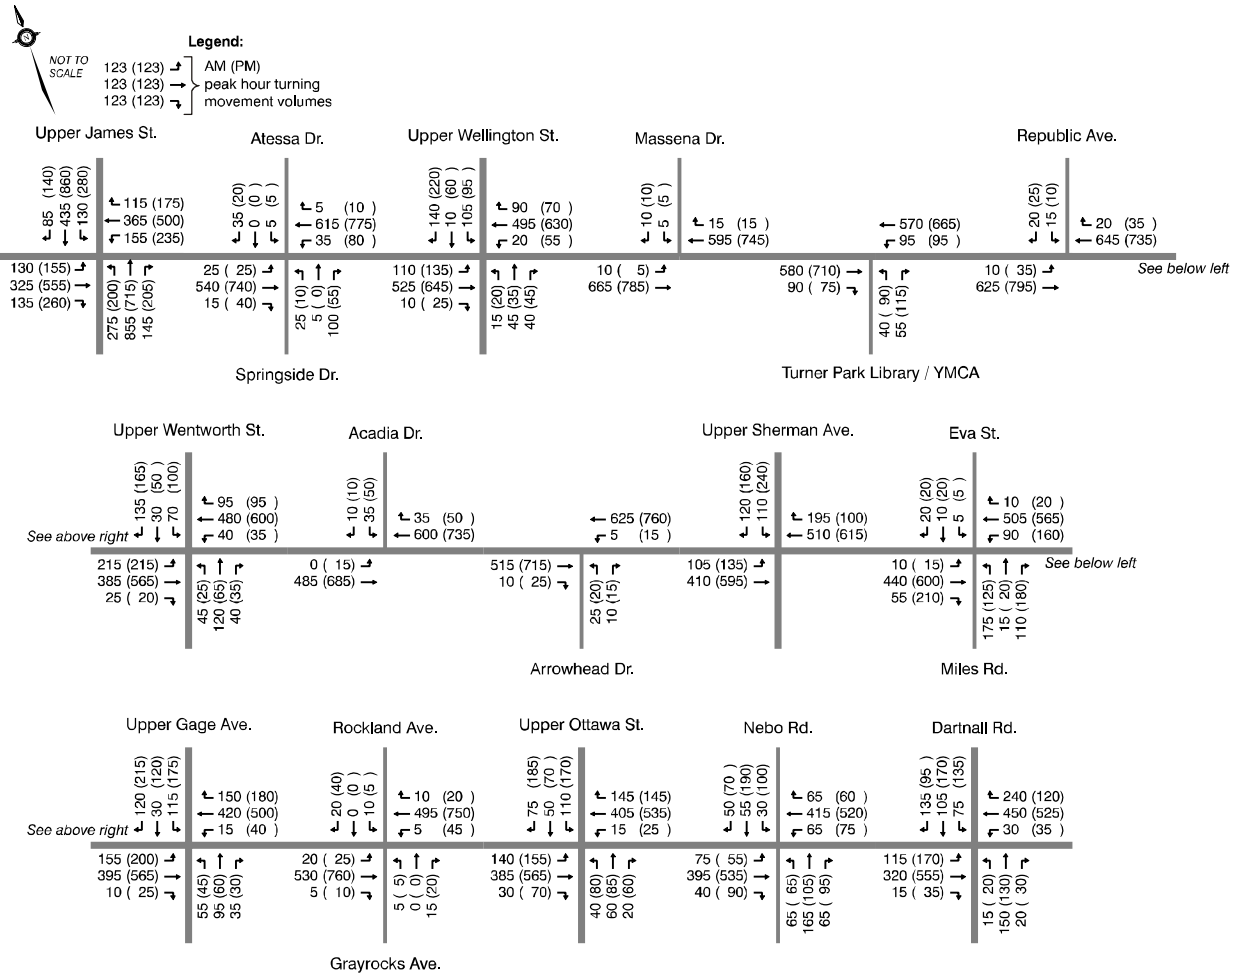
Route	Weekday					Saturday					Sunday				
	AM	Mid	PM	Eve.	Late	Early	Morn.	Aft.	Eve.	Late	Early	Morn.	Aft.	Eve.	Late
44 Rymal	15	30	15	30	60	30	30	30	30	30	30	30	30	30	30
27 Upper James	15	20	15	30	30	30	20	20	30	30	30	30	30	40	40
20 "A" Line Express	10	20	10	15-30	30	30	15	15	30	30	30	20	20	30	30
25 Upper Wentworth 26 Upper Wellington	12-15	15	12	20	30	30	20	20	30	30	30	30	30	30	60
23 Upper Gage 24 Upper Sherman	15	20	15	30	30	30	20	20	30	30	30	30	30	30	60
22 Upper Ottawa	15	20	15	30	30	30	30	30	30	50	30	30	30	60	60

2.5 Existing Traffic Volumes

A set of representative baseline traffic volumes was determined from traffic data provided by the City of Hamilton. Because 2020 traffic volumes may not reflect typical conditions due to the effect of the COVID-19 pandemic, 2019 was assumed as a base year. The count data included many intersections that were counted in 2019; older traffic counts were used to fill in data gaps. Variability was observed from one count to another, reflecting seasonal variation or other factors; adjustments were made to smooth out variability where the surveyed traffic volumes appeared to be atypically high or low compared to other nearby intersections. Figure 6 presents the intersection turning movement volumes (rounded to the nearest five vehicles) that were established to represent typical existing (2019) conditions.

Figure 6: Existing Traffic Volumes



2.6 Existing Truck Activity

Trucks comprise the following percentage of traffic on Rymal Road:

- During the AM peak hour:
  - Approximately 7% of all traffic between Upper James Street and Upper Sherman Avenue; and
  - Approximately 10% of all traffic between Upper Sherman Avenue and Dartnall Road.
- During the PM peak hour:
  - Approximately 2% of all traffic between Upper James Street and Upper Ottawa Street; and
  - Approximately 5% of all traffic between Upper Ottawa Street and Nebo Road.
- During daytime hours on a typical weekday:
  - Approximately 4–6% of all traffic between Upper James Street and Nebo Road; and
  - Approximately 7–8% of all traffic between Nebo Road and Dartnall Road.

2.7 Existing Pedestrian and Cycling Activity

The intersection turning movement counts listed in Section 2.5 also include the number of pedestrians crossing each leg of the intersection. Table 3 lists the pedestrian activity at signalized intersections along the corridor during the AM and PM peak hours.

Table 3: Existing Pedestrian Crossing Activity at Signalized Intersections

Rymal Road at:	AM peak hour				PM peak hour			
	N leg	S leg	W leg	E leg	N leg	S leg	W leg	E leg
Upper James Street	14	17	16	31	12	14	23	20
Atessa Drive / Springside Drive	2	3	0	1	0	4	0	0
Upper Wellington Street	5	5	2	12	3	2	5	7
Upper Wentworth Street	19	7	17	15	38	7	25	10
Library / YMCA Driveway	0	0	9	3	0	2	9	23
Upper Sherman Avenue	8	3	3	2	24	6	6	3
Miles Road	4	1	2	1	5	0	9	2
Upper Gage Avenue	14	9	4	15	22	13	10	26
Rockland Avenue / Grayrocks Avenue (IPS)	10	0	4	0	13	3	5	0
Upper Ottawa Street	3	1	0	5	5	2	1	3
Nebo Road	9	4	13	4	4	5	10	3
Dartnall Road	0	0	3	0	1	1	6	0

Pedestrian activity is generally low at most intersections. The intersections with the most pedestrian activity are at Upper James Street, Upper Wentworth Street and Upper Gage Avenue, where an average of approximately one pedestrian was recorded as crossing in each direction per cycle. These correspond to intersections with adjacent commercial nodes (including supermarkets) as well as HSR transfer points. Other intersections experience lower levels of pedestrian activity. The IPS at Rockland Avenue / Grayrocks Avenue experiences a demand of approximately 4 to 5 pedestrians crossing Rymal Road per hour.

Starting in 2018, the City's intersection turning movement counts include a 7-hour total of cyclists on each intersection approach. Table 4 indicates the total number of cyclists at those intersections where data are available. Cycling activity is currently minimal (an average of 2 cyclists per hour or fewer).

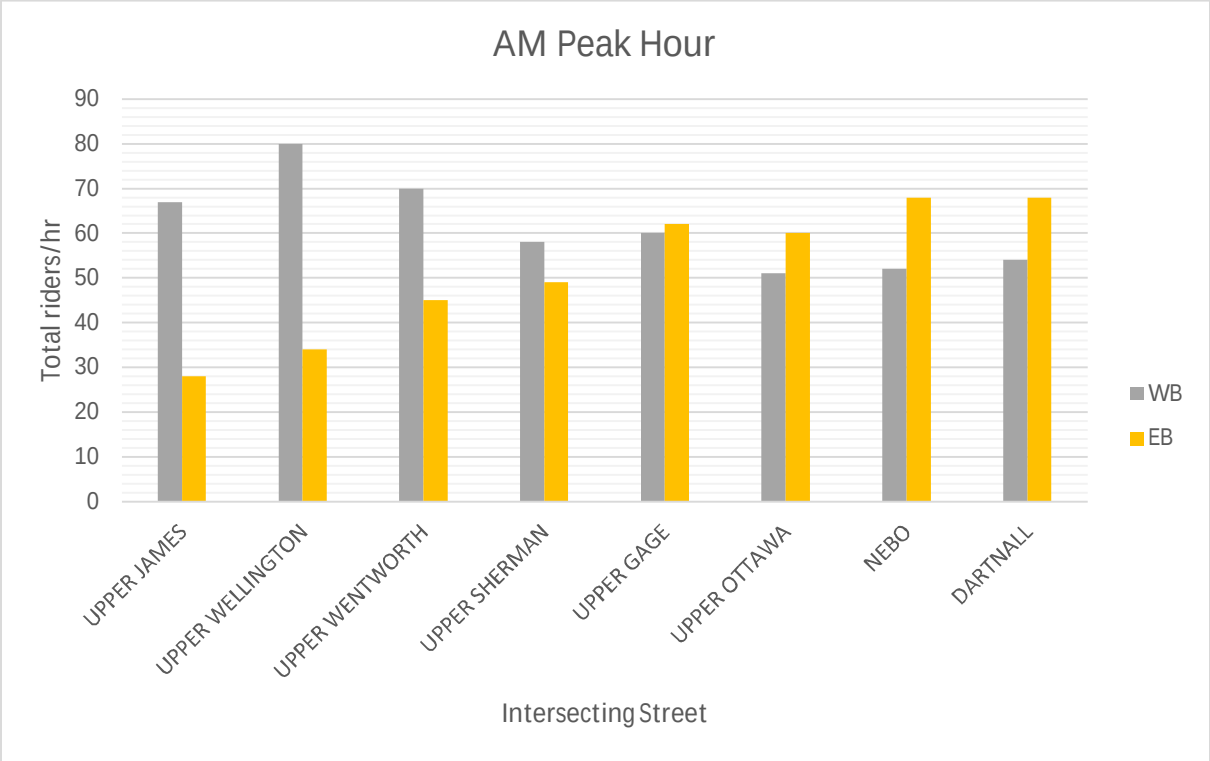
Table 4: Existing Cycling Activity

Rymal Road at:	Date	Total Cyclists (7 hours)				
		N leg	E leg	S leg	W leg	Total
Upper Wentworth Street	October 30, 2019	4	1	7	3	15
Arrowhead Drive	September 25, 2018	0	6	0	3	9
Upper Sherman Avenue	April 1, 2019	0	0	0	0	0
Eva Street / Miles Road	November 27, 2019	0	1	0	0	1
Upper Gage Avenue	April 10, 2019	2	2	3	2	9
Grayrocks Avenue / Rockland Avenue	November 26, 2019	1	2	0	0	3
Upper Ottawa Street	October 3, 2019	0	1	1	0	2
Nebo Road	November 26, 2019	0	0	0	0	0
Dartnall Road	November 26, 2019	0	0	1	1	2

2.8 Existing Transit Ridership

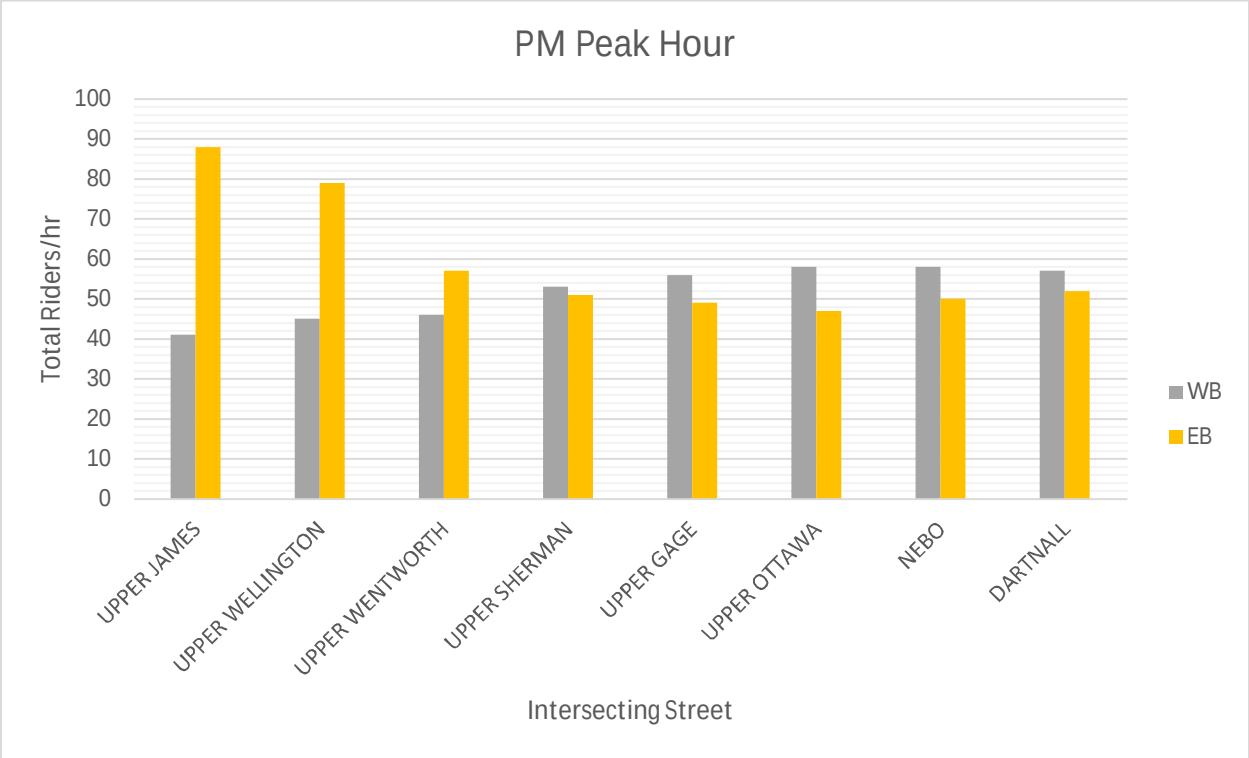
Historical (fall 2019, pre-COVID) ridership levels on the 44 Rymal route were provided by HSR. Ridership data were collected through automated passenger counting (APC) equipment that is installed on HSR buses. Figure 7 and Figure 8 illustrates the accumulated peak hour ridership by direction at major intersection along Rymal Road.

Figure 7: AM Peak Hour Ridership



During the AM peak hour, bus loading increases as buses travel westbound and eastbound through the study area; the maximum point ridership is approximately 80 passengers/hour westbound (departing Upper Wellington Street) and approximately 70 passengers/hour eastbound (approaching Dartnall Road). At a 15-minute headway, this would correspond to an average loading of up to 20 riders per bus.

Figure 8: PM Peak Hour Ridership



During the PM peak hour, bus loading decreases as buses travel westbound and eastbound through the study area; the maximum point ridership is approximately 90 passengers/hour eastbound (departing Upper James Street) and approximately 60 passengers/hour westbound (between Dartnall Road and Upper Ottawa Street). At a 15-minute headway, this would correspond to an average loading of up to 22 riders per bus.

2.9 Existing Intersection Operations

Intersection operational analyses were completed using Trafficware's Synchro software (version 10). At signalized intersections, the volume-to-capacity (v/c) ratio, average vehicular delay, level of service and 95th percentile queue were noted for each individual movement, and the average delay and level of service were noted for the intersection as a whole. At unsignalized (stop-controlled) intersections, the v/c ratio, delay, level of service and 95th percentile queue were noted for any stop-controlled movements. Level of service definitions are provided in Appendix A. Synchro reports are provided in Appendix B.

Table 5 presents the analysis results at signalized intersections. Table 6 presents the results for unsignalized (stop-controlled) intersections. The IPS at Rocklands Avenue / Grayrocks Avenue was assessed as a signalized intersection, but with results shown only for the signal-controlled east-west movements.

Table 5: Existing Signalized Intersection Operations

Overall	—	B	16.1	—	—	B	17.8	—

The signalized intersections along the corridor are all operating at good levels of service (LOS A to B) during the AM and PM peak hours, with the following exceptions:

- The intersections at Upper James Street and at Miles Road / Eva Street are operating at LOS C to D.
- The intersections at Upper Ottawa Street and at Nebo Road are operating at LOS C.

At most signalized intersections, the east-west movements on Rymal Road are operating at LOS A to B, while the side street movements are operating at poorer levels of service (mostly between LOS C and E, and in some cases LOS F). The poorer levels of service on the side street approaches reflect a long cycle length along the corridor (120 seconds) and timing plans that have been configured to favour east-west travel.

The only significant existing capacity constraint along the corridor is at the intersection with Miles Road/ Eva Street. This location experiences significant turning movement volumes to/from the south leg of the intersection; the northbound approach is at or near capacity during the AM and PM peak hours, and the westbound left turn is near capacity during the PM peak hour.

Table 6: Existing Unsignalized Intersection Operations

During the AM peak hour, the unsignalized intersections that were included in the assessment are all operating at reasonable levels of service (LOS C to D for left turn or shared lanes; LOS B for right turn movements). During the PM peak hour, the left turn or shared lanes on Arcadia Drive and Arrowhead Drive are operating at poorer levels of service (LOS E to F), reflecting higher levels of delay. Notwithstanding, all unsignalized intersections included in the assessment have sufficient capacity to accommodate existing traffic volumes.

3.0 Collision Review

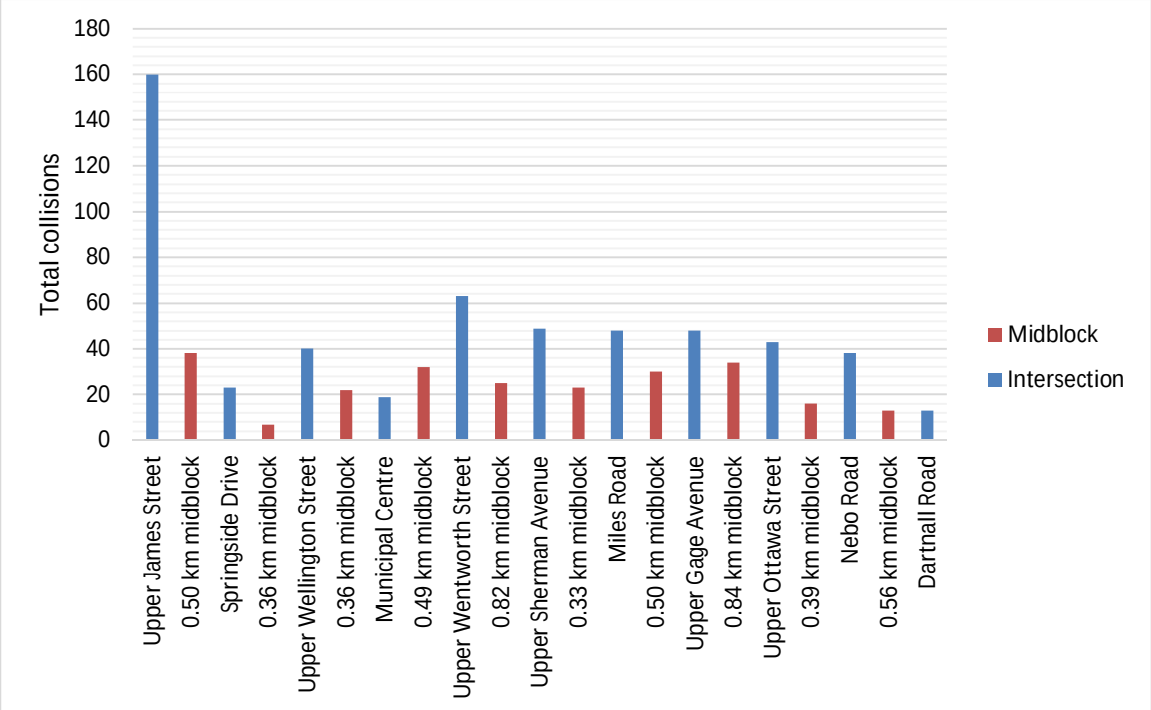
The City of Hamilton provided five years (2015 through 2019) of collision records for the Rymal Road corridor between Upper James Street and Dartnall Road, encompassing a total of 784 individual collisions. These collision records were reviewed to determine whether any patterns could be identified.

3.1 Collision Frequency by Location

Figure 9 presents the total number of collisions reported by location. Collisions occurred with the frequency at the main signalized intersections along the corridor. By a wide margin, the location experiencing the greatest number of collisions was the intersection with Upper James Street (160 collisions over five years); by comparison, the next highest location was the intersection with Upper Wentworth Street (63 collisions over the same five-year period).

There were 8 collisions reported at the intersection with Massena Drive; no other unsignalized experienced more than 6 collisions over this five-year period.

Figure 9: Geographic Distribution of Collisions



3.2 Collision Frequency by Year

On average, 156 collisions were reported each year within the study area. Table 7 presents the collision frequency per year at each location and across the entire corridor.

Collisions occurred more frequently in 2019 (204 collisions, compared to an average of 145 per year in the preceding four years). The majority of this increase was in the section east of Upper James Street, and in the section between Upper Wellington Street and west of Upper Wentworth Street.

Table 7: Collision Frequency by Year

There was construction at various locations along the corridor in 2017, consisting of construction of sidewalks and/or paved shoulders. However, the overall collision frequency along the corridor that year was the same as the preceding year and did not appear to be affected by construction activities.

3.3 Collision Frequency by Month

Table 8 presents the collision frequency by month of the year. In most months, the collision frequency throughout the corridor was within 10% of the monthly average; October was slightly underrepresented.

Table 8: Collision Frequency by Month

3.4 Collision Frequency by Day of Week

Table 9 presents the collision frequency by day of week, as well as the average per weekday and per weekend day. Fridays and Saturdays were overrepresented (approximately 150 collisions each), while Monday was underrepresented (only 53 collisions).

Table 9: Collision Frequency by Day of the Week

3.5 Collision Frequency by Hour

Table 10 and Table 11 present the collision frequency by hour (before noon and after noon, respectively).

Figure 10 presents the hourly collision profile graphically, as well as the eastbound and westbound hourly traffic profile (as measured between Nebo Road and Dartnall Road, where hourly traffic volumes were available). When comparing against traffic volumes, collision activity is understated in the morning, and overstated during the late afternoon and the PM peak period. (For example, the hour starting at 4:00 PM experiences approximately 8% of daily traffic but approximately 12% of all collisions.)

Table 10: Collision Frequency by Hour (AM)

Total	11	10	763	784
% of total	1%	1%	97%	100%

Of the 11 pedestrian collisions, roughly half (5 collisions) were concentrated at the intersection with Upper Wentworth Street. One of these involved a van that lost control on icy pavement. The other four involved motorists that failed to yield to pedestrians while completing a turn (two southbound right turns; one southbound left turn; one eastbound left turn). The pedestrian collisions all resulted in non-fatal injuries.

The majority of the 10 cyclist collisions occurred in the 1.6-kilometre section between Upper Sherman Avenue and Upper Ottawa Street. Within that section, the collisions were relatively evenly distributed, with no more than 2 collisions reported at any one location. Although the number of cycling collisions can be considered to be low on an absolute basis (only 2 per year), this is offset by the low level of existing cycling activity within the corridor (on average, 2 cyclists per hour or fewer where cyclists have been included in intersection traffic counts). Roughly half (4 collisions) were due to drivers failing to yield the right of way. The other six involved motorists that were following too close and making improper turns with one instance of a motorist driving properly. Of the 10 cyclist collisions, 8 collisions resulted in non-fatal injuries with the remaining collisions resulting in property damage only.

3.7 Collision Frequency by Severity

Table 13 breaks down the severity of the collisions within the corridor.

- 67% of the collisions were non-reportable;
- 20% resulted in non-fatal injury;
- 13% resulted in property damage only (PDO); and
- No collisions resulted in a fatality.

Table 13: Collision Frequency by Severity

Location	Non-Fatal Injury	Property Damage Only	Non-Reportable	Total
Upper James Street	21	25	114	160

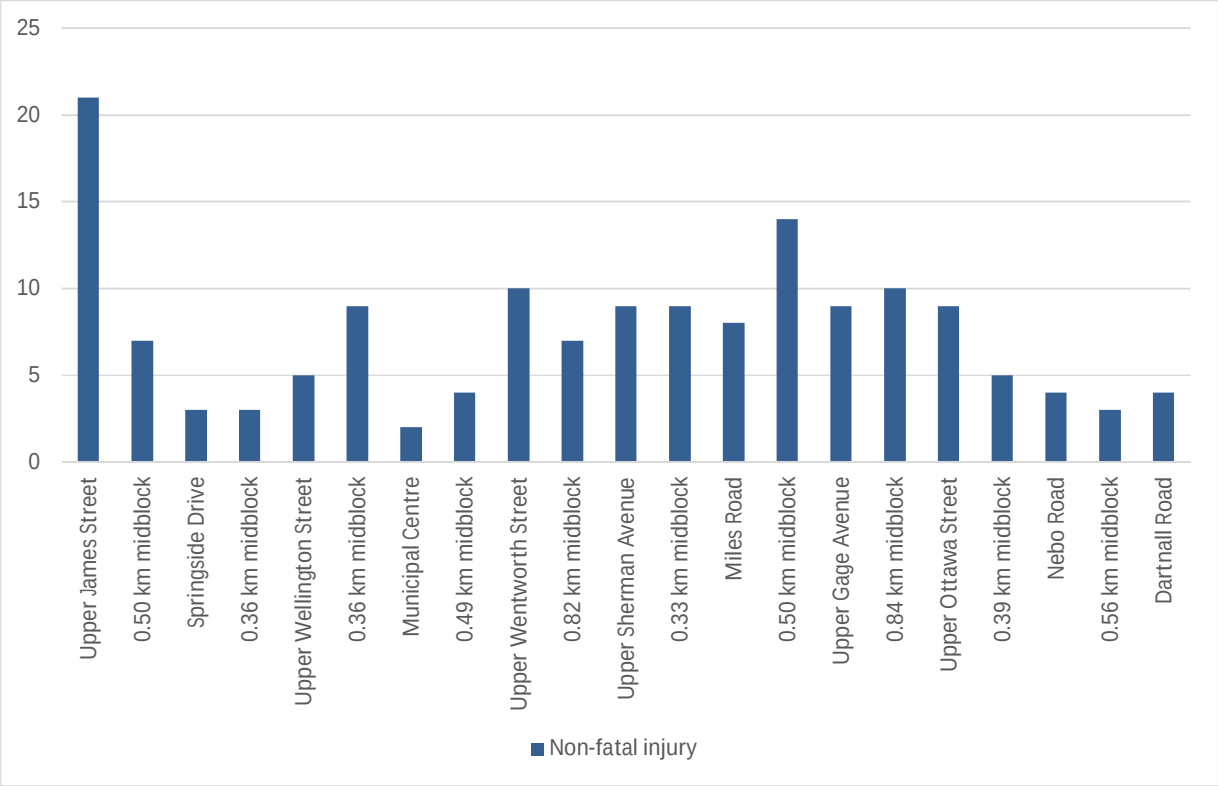
Total	155	102	527	784
% of total	20%	13%	67%	100%

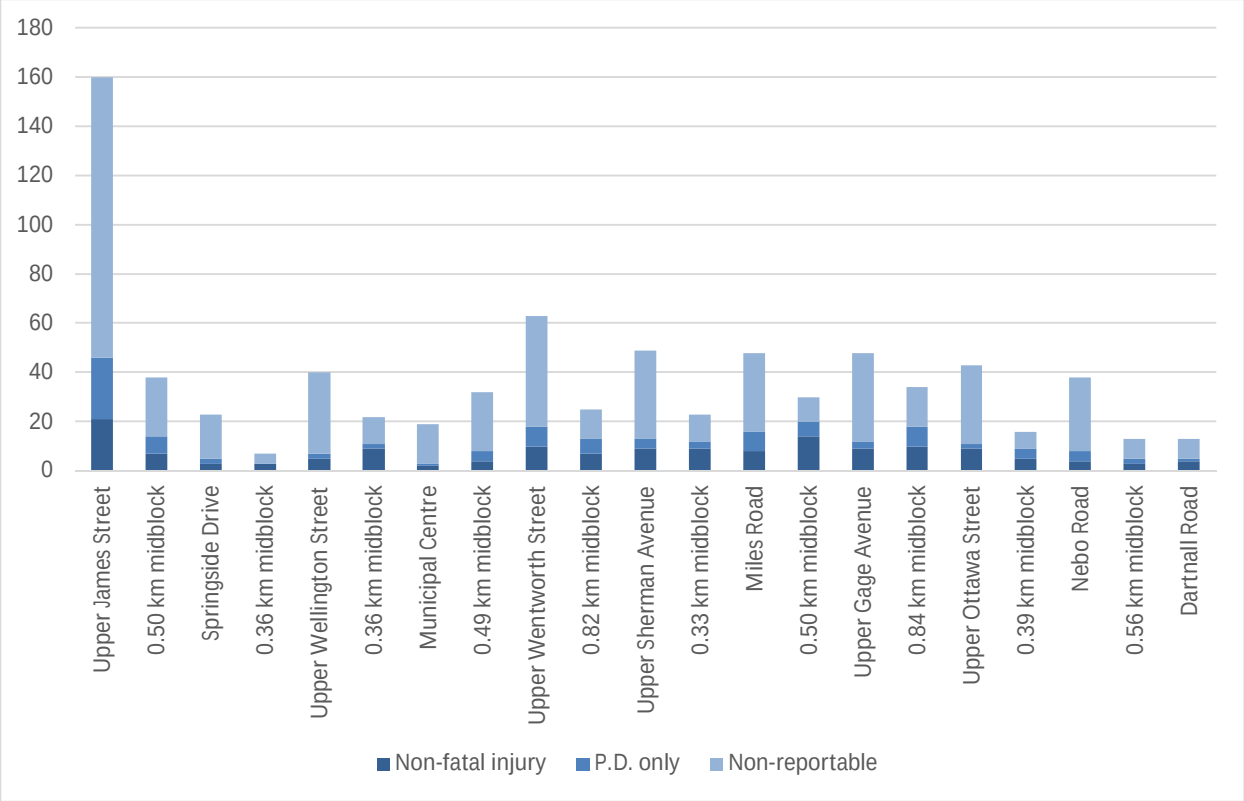
Figure 11 illustrates the number of injury collisions at each location; Figure 12 illustrates all collisions including PDO and non-reportable[1] collisions. Although the Upper James Street intersection experienced a much higher collision frequency than any other location along the corridor, a high proportion of these were PDO and non-reportable collisions. The midblock sections along the central part of the corridor experienced a higher proportion of injury collisions (particularly between Miles Road and Upper Gage Avenue).

Figure 11: Injury Collisions by Location



[1] Collisions are considered non-reportable when certain conditions do not exist (e.g., no injuries; damage is less than $2,000; no damage to public or private property; did not involve a pedestrian; did not involve a criminal act such as DUI; etc.).

Figure 12: Collision Severity by Location



3.8 Collision Frequency by Environmental Conditions

Table 14 presents the collision frequency based on the environmental conditions at the time of the collision. For the majority of collisions, adverse environmental conditions were not reported as being a contributing factor. Environmental conditions were not noted for 39% of collisions. Of those collisions where environmental conditions were reported, 84% occurred during clear weather, 9% occurred during rainy conditions, and 7% occurred during winter weather or other conditions.

Table 14: Collision Frequency by Environmental Conditions

3.9 Collision Frequency by Lighting Conditions

Table 15 presents the collision frequency based on the lighting conditions at the time of the collision. For the majority of collisions, poor lighting conditions were not reported as being a contributing factor. Lighting conditions were not noted for 67% of collisions. Of those collisions where lighting conditions were reported, 75% occurred in daylight, 18% occurred at night, and 6% occurred during dawn or dusk.

3.10 Collision Frequency by Road Surface Conditions

Table 16 presents the collision frequency based on the road surface conditions at the time of the collision. For the majority of collisions, adverse road surface conditions were not reported as being a contributing factor. Road surface conditions were not noted for 67% of collisions. Of those collisions where road surface conditions were reported, 75% occurred on dry pavement, 18% occurred on wet pavement, and 8% occurred on snowy, slushy or icy pavement.

3.11 Collision Frequency by Initial Impact Type

Table 17 presents the collisions broken down by initial impact type. The following was noted:

- More than half of all collisions (56%) were rear-end collisions;
- 15% of collisions were angle collisions;
- 11% of collisions were sideswipe collisions, but this is skewed by the results at Upper James Street; elsewhere in the corridor, sideswipe collisions comprised only 8% of collisions;
- 8% of collisions involved turning vehicles;
- 12% of collisions were in other categories (primarily single motor vehicle collisions).

Table 17: Collision Frequency by Initial Impact Type

% of Total	2%	15%	56%	11%	8%	0%	5%	3%	100%

Rear-end collisions comprised more than half of the collisions along the corridor, and 357 (81%) of them involved eastbound or westbound vehicles on Rymal Road. Adverse road surface conditions can generally contribute to rear-end collision risk, but in this case they were only identified as being a factor in 30 (8%) of these collisions. The frequency of these rear-end collisions was observed to be highest between the midday period and the end of the PM peak period. Potential contributing factors may include the eastbound lane drop east of Upper James Street; the extent of direct property access, combined with traffic characteristics (the relatively high volumes in a single lane; longer queues at intersections) may also be a factor.

3.12 Summary of Collision Activity

Between 2015 and 2019 (inclusive), 784 collisions were reported within the study area, for an average of 156 collisions per year. By far the highest frequency of collisions was observed at the Upper James Street intersection (20% of all collisions).

Collisions were roughly 40% more frequent in 2019 than in the four preceding years. Collisions were relatively evenly distributed throughout the year; occurred more frequently on Fridays and Saturdays compared to other days of the week; and occurred less frequently during the morning, and more frequently during the late afternoon and PM peak period, than the hourly traffic volume profile might suggest.

The majority of collisions were non-reportable or resulted in property damage only; 20% resulted in injury, and no collisions resulted in a fatality. Midblock collisions were more likely to result in injury than intersection collisions.

Most collisions occurred under ideal environmental, lighting, and road surface conditions.

More than half (56%) of all collisions were rear-end collisions. Most of these involved eastbound or westbound vehicles (i.e., few occurred on intersecting streets), and most occurred on dry pavement (i.e., wet or slippery roadways were less of a factor than might normally be expected). Potential contributing factors may include the eastbound lane drop east of Upper James Street; the extent of direct property access, combined with traffic characteristics (the relatively high volumes in a single lane; longer queues at intersections) may also be a factor.

The widening of the road to two lanes per direction may help to address the pattern of rear-end collisions (reduced queue lengths; reduced friction at unsignalized right turns), although this may be offset by other factors (potential for increased sideswipe collisions; potential for higher midblock speeds and higher turning speeds at intersections; longer pedestrian crossing distances).

Eleven collisions involved pedestrians, roughly half of which occurred at Upper Wentworth Street. Ten collisions involved cyclists, most of which occurred between Upper Sherman Avenue and Upper Ottawa Street. Most of these collisions resulted in non-fatal injuries.

The number of cycling collisions was low, although this should be considered in the context of the low existing level of cycling activity in the corridor. There are currently no dedicated bicycle facilities in the corridor. A bicycle facility would provide an improved sense of security for cyclists, although a two-way cycling facility would likely not have addressed the reported collisions; all were angle collisions and most involved right-turning motorists and "contraflow" cyclists approaching from the right, which would be reinforced with a two-way cycling facility.

4.0 Future Policy Context

The following City of Hamilton plans and policies were reviewed for applicability to the Rymal Road review.

4.1 Official Plan

From the perspective of the urban structure, the City of Hamilton Official Plan designates Rymal Road throughout the study area as one of a number of "secondary corridors", which generally correspond with the lower-priority rapid transit corridors (see Section 4.3.1). They are intended to be mixed-use corridors with retail and service clusters at key intersections and medium-density housing between these clusters, and with a focus on moderate-scale intensification, introduction of multiple-storey mixed use buildings, and measures to create "vibrant pedestrian and transit oriented places through investment in infrastructure, residential intensification, infill and redevelopment, and careful attention to urban design."

Schedule "C" of the Urban Hamilton Official Plan ("Functional Road Classification") identifies a southerly extension of Upper Sherman Road from Rymal Road to the urban boundary. However, the corresponding schedule of the Rural Hamilton Official Plan ("Rural Functional Road Classification") does not indicate a further southerly extension into the rural area.

4.2 Transportation Master Plan

The City of Hamilton completed an update to their Transportation Master Plan (TMP) in 2018. From an infrastructure perspective, it included recommendations related to active transportation, transit, roads, complete-livable better streets, and connectivity. As part of the TMP update, separate background reports were prepared discussing elements such as goods movement, the cycling network, and road safety.

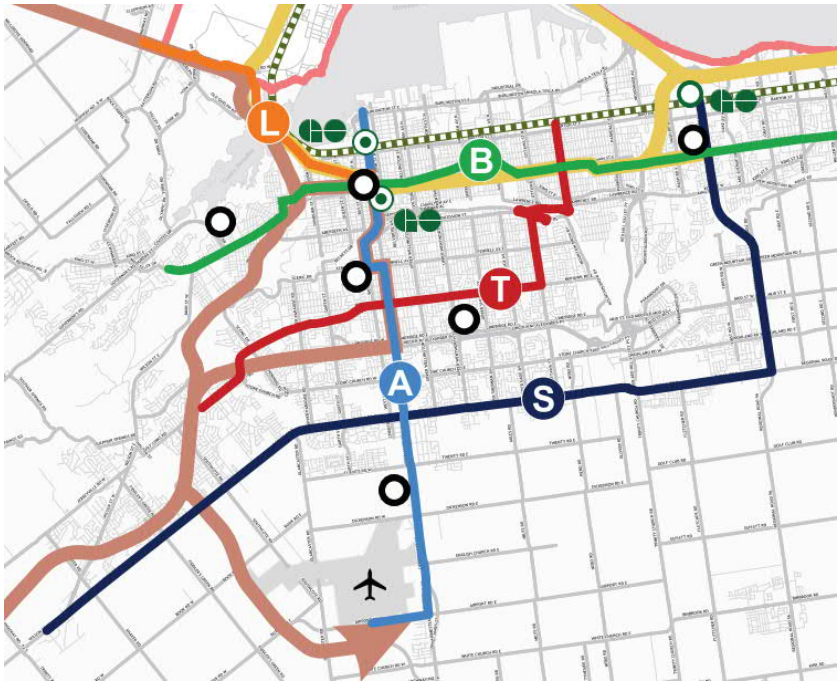
The TMP does not identify Rymal Road for widening within the study area. It does recommend the widening of Rymal Road / Garner Road west of West 5th Street (which has subsequently been completed as far west as Upper Paradise Road), as well as the widening of Upper Wellington Street between Rymal Road and the Lincoln Alexander Parkway. It also identified the potential extension of the Upper Red Hill Valley Parkway southerly and westerly to Highway 6 south of Mount Hope as an alternate truck route between the Red Hill Valley Parkway and the airport, although this link was identified at a conceptual level only.

4.3 Transit Policy and Planning Studies

4.3.1 BLAST Network

The Rymal Road corridor is part of the City's proposed "BLAST" rapid transit network, developed in 2008 in conjunction with the Metrolinx Regional Transportation Plan (RTP), known as "The Big Move". The BLAST network, shown in Figure 13, consists of five rapid transit corridors that were identified in the Metrolinx RTP. The S-line was envisioned to extend east-west along the southern limits of the City along Garner Road and Rymal Road, before turning to the north and continuing along Centennial Parkway to Eastgate Square. This network was subsequently carried forward as part of the City's Transportation Master Plan update in 2018.

Figure 13: Proposed BLAST Rapid Transit Network (2018)



Source: Map 2, 2018 Transportation Master Plan

To date the primary focus has been on the B-line (King/Main Street corridor) and A-line (Upper James Street corridor). The B-line is an existing high-ridership corridor with a long history of express service, and the A-line is an emerging corridor serving a strategic market between downtown and the upper city. The Big Move identified these corridors in the 15-year priority network. The T-line, along Mohawk Road and Kenilworth Avenue, was identified as a secondary corridor in Metrolinx's 25-year network. By comparison, the S-line was identified more conceptually as a potential longer-term corridor; at the time of their RTP, Metrolinx anticipated it to occur beyond the 25-year horizon.

The type of infrastructure and service associated with the S-line has not been determined to this point, but is anticipated to be a bus-based service. This could include buses operating in reserved lanes; limited-stop express service in mixed traffic overlaying the existing local service (similar to the existing A-line); or some intermediate combination (e.g., implementing high-frequency service on the existing route; construction of enhanced passenger amenities and/or strategic priority measures).

4.3.2 Rapid Ready

In preparation for the implementation of the BLAST network, the City of Hamilton prepared a report ("Rapid Ready") in 2013, documenting policies and initiatives to support the planned development of a rapid transit network in Hamilton (focusing primarily on the A-line and B-line light rail corridors). It identified the following seven "key actions" as interim measures to support those corridors:

1. Building a rapid-ready transit network: Enhance and increase bus services, restructure the route network around rapid transit corridors.
2. Creating an accessible transportation system: Transit and the transportation system will be fully accessible.
3. Making transit faster and more reliable: Transit must offer journey times competitive to driving to be an attractive choice.
4. Creating a refined transit customer experience: Provide customer service and amenities to make it easier and more attractive to use transit.
5. Providing safe and convenient walking and cycling environments: Encourage walking and cycling for short- and medium-distance trips while creating strong linkages to transit.
6. Integrating corridor and community planning: Planning for and building the city around transit.
7. Developing seamless multi-modal connections: Integrating different modes of transportation to maximize connections to transit.

From a service and route structure perspective, the report recommending enhancing the base transit network to build ridership in the B-Line and A-Line rapid transit corridors and to feed those corridors. It recommended increased service levels (frequency; duration; service area coverage) to increase the attractiveness of the HSR network as a whole and to grow ridership and establish travel patterns associated with planned rapid transit corridors. While the primary focus was the B-Line and A-Line corridors, the study also suggested the designation of a frequent transit network that conceptually included the eastern half of the S-Line (east of Upper James Street).

4.3.3 10-Year Local Transit Strategy

Leading out of the Rapid Ready study, the 10-Year Local Transit Strategy was prepared by City staff in February 2015 in response to Council direction requesting recommendations and a financial strategy to increase service with a goal of reaching 80-100 riders per capita by 2025.

Part of the strategy was developing the BLAST network to promote ridership growth:

- Increasing service levels on the A, B & T-Line corridors towards rapid transit;
- Introducing express service on the S and L lines;
- Strengthening the connectivity between the terminals/nodes (Downtown, McMaster University, Lime Ridge Mall, Eastgate Square, Mohawk College, Meadowlands, Valley Park, MTC/Airport); and
- Feeding the future rapid transit corridors.

On the BLAST corridors, the strategy identified shifting modal split incrementally, first through improved service on the existing lines, then by overlaying express bus service before implementing higher-order transit measures.

Associated measures included implementing transit priority measures (including signal priority, queue jump lanes and dedicated lanes) at strategic locations in the network, and improving headways to 10 minutes or better on major BLAST corridors to differentiate the quality of service on those lines.

4.3.4 S-Line Ridership Study

Although the Metrolinx RTP initially identified the S-Line as a longer-term priority (beyond that study's 25-year horizon of 2033), any changes to Rymal Road resulting from the current study offer an opportunity to advance any transit measures associated with the S-Line. To that end, a separate ridership study was completed by Dillon in September 2022 as part of this project. The study estimated future transit ridership along the Rymal Road corridor within the study area, and made recommendations as to appropriate service levels and supporting infrastructure to meet that projected ridership.

The study prepared ridership forecasts along the entire S-Line corridor. These forecasts refer to point ridership (the number of riders passing a given point in each direction) during the AM peak hour, and were prepared for 2031, 2041 and 2051 horizons. The following ridership levels were forecast for the central section of the S-Line (Upper James Street to Dartnall Road):

- 60 to 70 passengers per direction per hour under existing conditions;
- 100 to 125 passengers per direction per hour by 2051 after accounting for population growth within 1 kilometre of the S-Line corridor;
- 235 to 285 passengers per direction per hour by 2051 after applying higher transit trip rates (increased transit modal split); and
- 400 to 485 passengers per direction per hour by 2051 if service improvements along Rymal Road induce riders to shift to the S-Line instead of using other routes for the same trip.

The study assessed the need for transit priority measures based on ridership and service frequency. The potential range of measures included the following:

- No transit measures required.
- Priority bus corridor:
  - Transit signal priority and/or physical intersection measures (such as queue jump lanes); and/or
  - Managed lane for transit and high occupancy vehicles.
- Exclusive transit lane:
  - Not separated from general traffic; or
  - Physically separated from traffic.

The following two criteria were established to evaluate the need and/or level of transit priority:

- Number of transit passengers at peak points on each segment.
  - Continuous Transit Priority (TP), or exclusive facilities, should be considered when there are more than 700 passengers per hour per direction (based on the approximate equivalent person capacity of a standard vehicle lane).
  - Isolated Transit Priority measures should be considered when there are between 300 and 700 passengers per hour per direction.
- Number of bus routes and combined headway within corridor.
  - Transit Priority should be considered where there are frequent buses (frequent defined as a bus arriving almost every signal cycle — estimated as 30 buses per hour assuming a 120 second cycle).

This evaluation found the following:

- On the basis of ridership, the 2051 forecasts would warrant isolated transit priority measures within the majority of the S-Line corridor, but not a dedicated exclusive facility.
- On the basis of bus headways, the number of buses per hour would not warrant transit priority through the majority of the S-Line corridor. The section between Upper James Street and Dartnall Road was identified as an exception, with transit priority measures being nearly justified. This section is different because it includes two segments (between Upper Wellington Street and Upper Wentworth Street; between Upper Sherman Avenue and Upper Gage Avenue) where north-south routes travel along Rymal Road as part of an end-of-line loop.

4.3.5 HSR Operational Plans

Through partnership with McMaster University, the City's Transit Division initiated a project known as "(Re)envision the HSR" in April 2018 to redesign the entirety of the HSR's transit system. The project undertook a full redesign of the HSR network to make Hamilton "rail ready" by structuring the transit network around the Hamilton LRT, and more generally to make the network more attractive in terms of residents' travel mode choices. A concept network was developed illustrating proposed transit operations on the opening day of Hamilton LRT operation; the proposed service plan was completed in

September 2022 and issued to City Council in April 2023, followed by a period of public and stakeholder feedback.

The April 2023 report to City Council documented policies and initiatives to support the redesigned HSR network. It identified the following seven objectives utilized when designing the network:

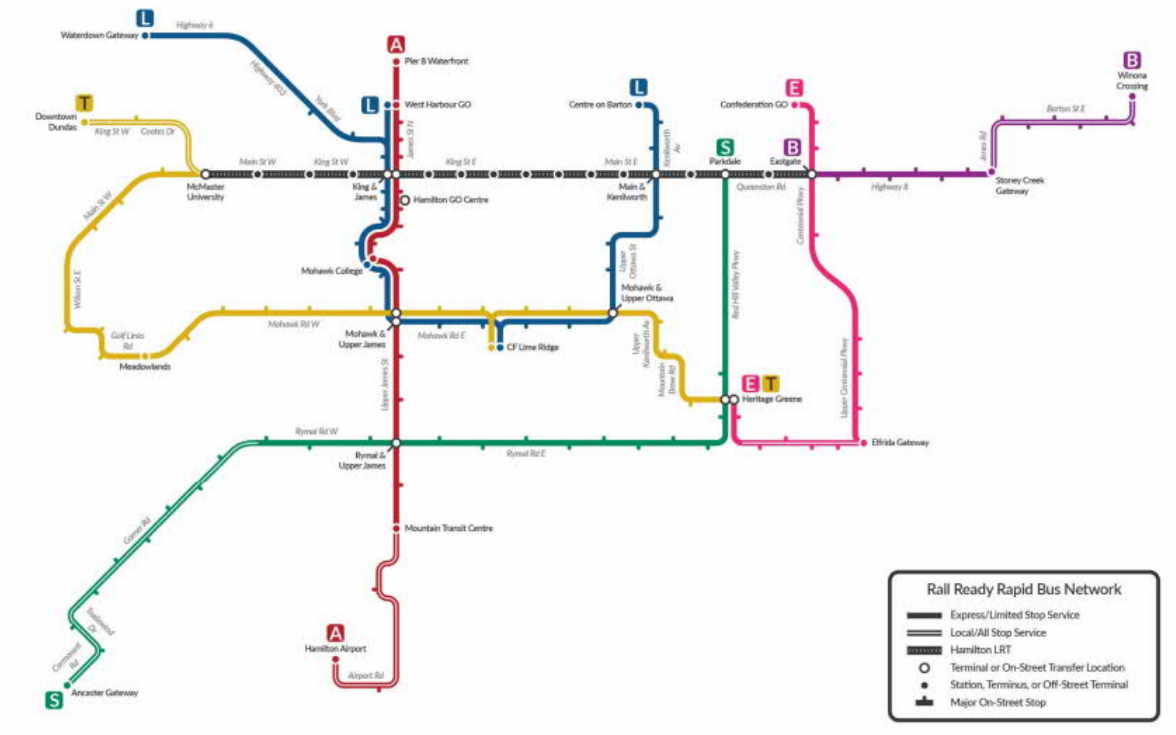
1. Maximizing service reliability;
2. Minimizing the number of transfers required;
3. Expanding service coverage area;
4. Improving infrastructure;
5. Improving regional transit service connectivity;
6. Expanding hours of service; and
7. Enhancing robustness of network to improve travel alternatives during service disruptions.

The new network concept divides routes according to the following hierarchy:

1. Rapid: Corresponds to the rapid transit network. High frequency (10-minute headways or better during peak periods). Limited stops (spacing of 500 metres or greater). May have dedicated transit lanes and/or transit signal priority.
2. Core: Major trunk routes operating along arterial roadways. Medium frequency (15-minute headways or better during peak periods). Moderate stop spacing of 250 to 400 metres.
3. Feeder: Routes running perpendicular to the LRT and designed to provide LRT access to riders originating outside walking distance from an LRT stop. Medium frequency (15-minute headways or better during peak periods).
4. Local: Lower-frequency (20-minute headways or better during peak periods) routes operating primarily on collector roadways, designed primarily for local access with shorter stop spacing (200 to 300 metres).
5. On-demand: Request-based transit service in areas where ridership levels are unable to support conventional fixed-route service.

The new rapid bus network (illustrated in Figure 14) includes a modified S-Line (also now known as Route 30). East of Upper James Street (connection to the A-Line) it would be a limited-stop route running to Heritage Greene, with stops at major north-south arterial roads, then travel express along the Red Hill Valley Parkway to the Parkside LRT stop. West of Upper James Street, it would be a limited-stop route as far as Redeemer University, then would be a local service running along Garner Road into the Ancaster Gateway hub.

Figure 14: Proposed "Rail Ready" LRT and Rapid Bus Network



The modified core, feeder and local routes within the study area are illustrated in Figure 16 and can be compared against the existing network illustrated in Figure 15. The proposed "rail ready" routes within the study area the following:

- A parallel local route (36 Rymal) along Rymal Road, serving riders originating beyond walking distance of an S-Line stop;
- A restructuring of the 25 Upper Wentworth / 26 Upper Wellington loop and the 23 Upper Gage / 24 Upper Sherman loop, such that 26 Upper Wellington travels west along Rymal Road to Upper James and then southerly to the Mountain Transit Centre terminal, and the other three routes converge at a loop on Upper Sherman Avenue; and
- Restructuring of the service within the Red Hill Business Park.

Figure 15: Pre-Covid Baseline Condition (2019) HSR Map (Excerpt)

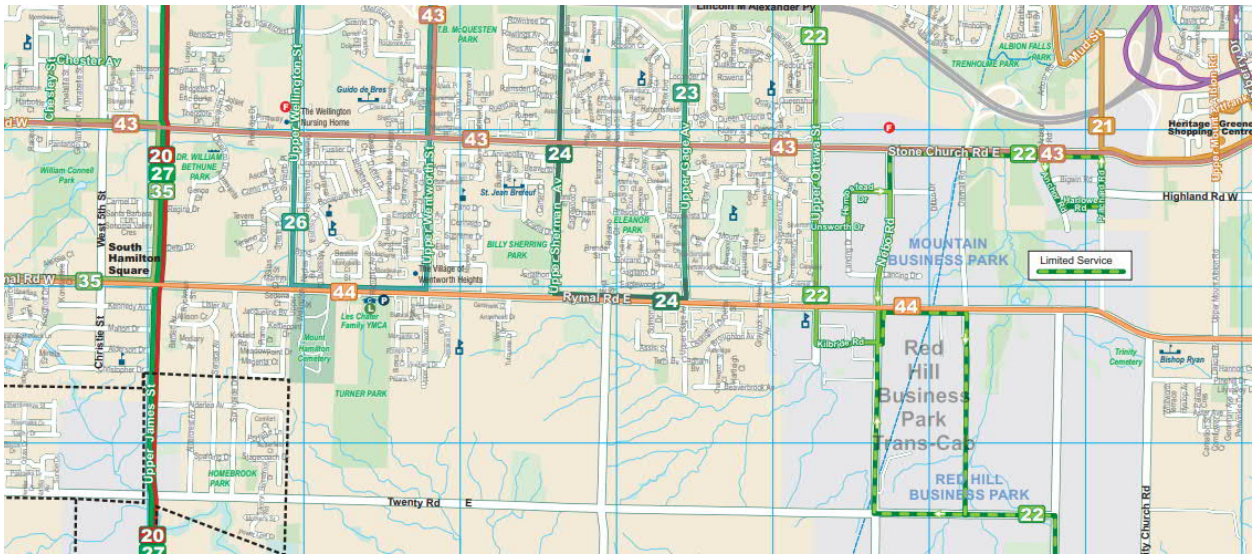


Figure 16: Proposed "Rail Ready" Transit Network Modifications (Excerpt)

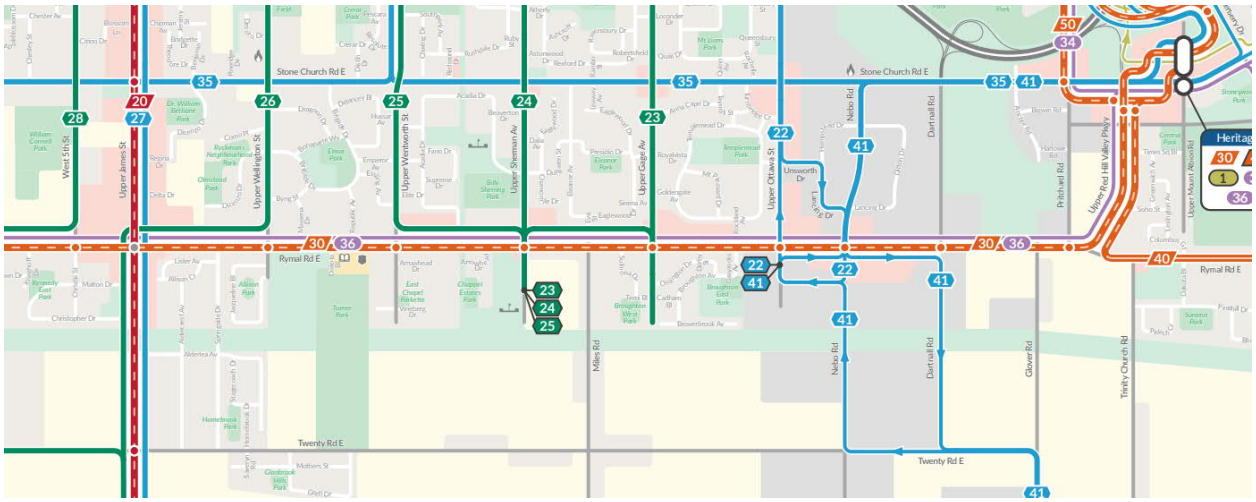


4.4 Truck Route Network

The City undertook an update to the Truck Route Master Plan (TRMP) in September 2020. The updated TRMP was published in April 2022.

The 2022 TRMP recommended that all truck routes existing within the study area at that time be maintained:

- The full Rymal Road corridor (including Garner Road) throughout the city;
- Upper James Street;
- Upper Wentworth Street (north of Rymal Road);
- Upper Gage Avenue (north of Rymal Road);

- Upper Ottawa Street;
- Nebo Road (as far south as Twenty Road); and
- Dartnall Road.

It also recommended the addition of the following links in the long term:

- Nebo Road (extension of existing truck route southerly from Twenty Road to Dickinson Road East); and
- Dartnall Road (extension of existing truck route southerly from Twenty Road to Dickinson Road East).

4.5 Cycling Master Plan

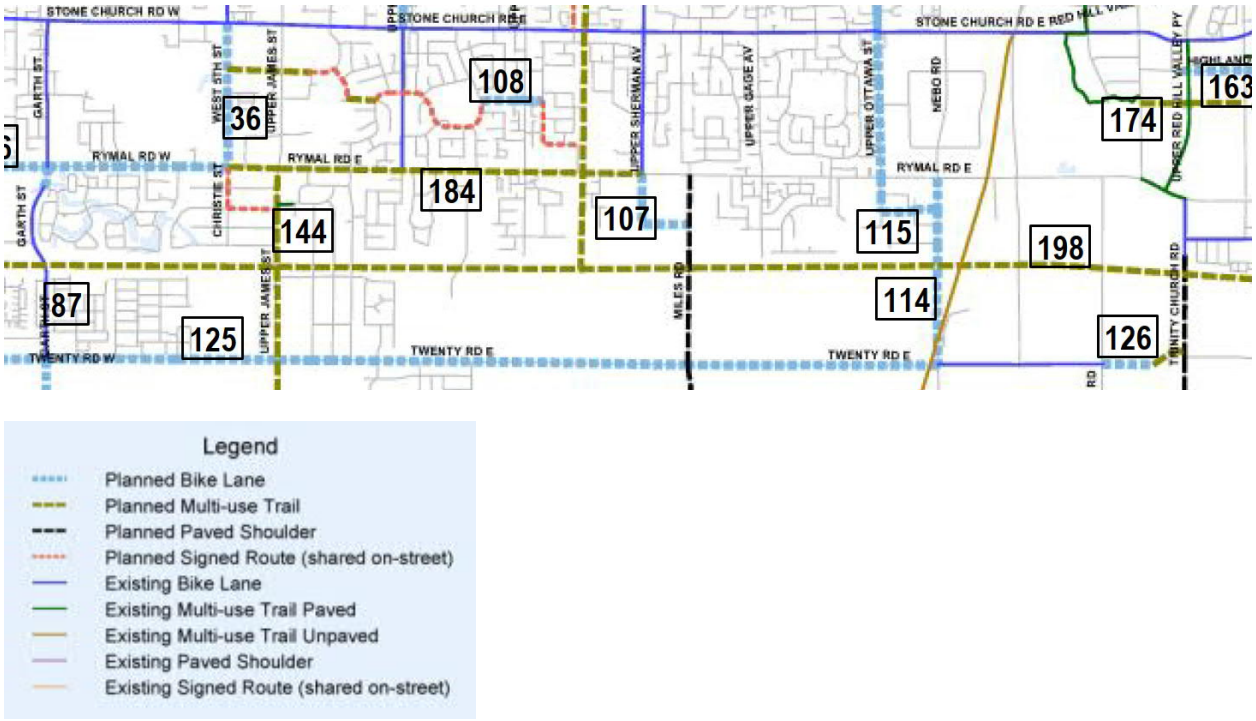
The City of Hamilton's Cycling Master Plan was updated in 2018 as a component of its overall Transportation Master Plan (TMP). The plan recommended an off-street multi-use trail along Rymal Road from Upper Sherman Avenue westerly to West 5th Street, and on-street bicycle lanes from that point westerly to Upper Paradise Road. (As part of recent reconstruction of Rymal Road west of the study area, a bicycle path beside a sidewalk was constructed for approximately 900 metres along the north side of Rymal Road crossing Garth Street, but was not extended easterly beyond Hazelton Avenue at that time due to property constraints.)

Additional cycling infrastructure was also identified on the following north-south routes intersecting with Rymal Road:

- An off-street multi-use trail along the north-south hydro corridor between Upper Wentworth Street and Upper Sherman Avenue, extending from south of Rymal Road to Mohawk Road;
- A southerly extension of the Upper Sherman Avenue bicycle lanes, south and east to Miles Road (recently completed as part of the Upper Sherman Avenue extension);
- Construction of bicycle lanes on Upper Ottawa Street and Nebo Road, from Twenty Road northerly to Mountain Brow Boulevard.

Figure 17 is an excerpt from the 2018 Cycling Master Plan illustrating the recommended cycling infrastructure in the study area.

Figure 17: Recommended Cycling Infrastructure from 2018 Cycling Master Plan



Source: Appendix A, Map 2, Cycling Master Plan Review and Update

4.6 Pedestrian Mobility Plan

The Hamilton Pedestrian Mobility Plan ("Step Forward") was completed in December 2012 by G. O'Connor Consultants Inc. and was prepared as a tool to be used to improve pedestrian environments in the city and to help achieve the pedestrian goals and objectives of the City of Hamilton's Transportation Master Plan and Official Plan.

The plan classifies the City of Hamilton into different context areas ranging from rural to urban for the purpose of identifying typical levels of pedestrian activity and appropriate types of pedestrian infrastructure. The full extent of the study area is classified as a "suburban" context area. The plan identified challenges generally associated with this context, including curvilinear local street patterns that can result in indirect travel paths; poor street and pedestrian connectivity; greater street widths than in older areas of the city; and longer distances between controlled crossings on arterial roads.

A toolbox was developed to facilitate the evaluation of existing pedestrian infrastructure and to be a guide for the design of new streets or reconfigurations of existing streets.

The 2018 TMP update recommended the development of new design criteria for Complete-Liveable-Better streets, which would build upon and/or supersede the 2012 report.

5.0 Future Traffic Volumes

Future traffic volumes were estimated by considering two potential components of traffic growth:

- Traffic generated by site specific developments within the study area; and
- Additional general background traffic growth as a result of changes in conditions or growth elsewhere in the region.

The general background growth rate was then calibrated against traffic forecasts for the Rymal Road corridor generated in the City's regional transportation model (which uses the EMME modeling platform).

The City's EMME model projects traffic volumes at a 2031 horizon. However, for the purposes of this study, a 20-year (2041) horizon has been considered.

5.1 Development Traffic

City staff provided a list of active development applications that could directly affect traffic volumes within the study area. Table 18 presents the location and description of the development applications that were considered in the analyses. In total, they would result in the following development yield along the corridor:

- 587 residential units;
- A 33,300 sq. ft. place of worship;
- 185,000 sq. ft. of retail and commercial space; and
- Two service stations and two other auto service facilities.

Table 18: Study Area Development Applications

Address	Location	Proposed Development
11 Springside Drive	SE corner Rymal / Springside / Atessa	15 stacked townhouse units
323 Rymal Road East	N side Rymal, NE corner of entrance to municipal centre	21 apartment units
544-550 Rymal Road East	S side Rymal opposite Acadia (access also via Upper Wentworth, Arrowhead)	8 single detached units 10 townhouses 69 stacked townhouse units 203 apartment units
620 Rymal Road East	S side Rymal between Arrowhead and Upper Sherman	33.3 ksf church
675 Rymal Road East	NE corner Rymal / Upper Sherman (No Frills plaza)	5.21 ksf commercial building (outparcel pad)
708 Rymal Road East	S side Rymal between Upper Sherman and Eva (Miles)	32 single detached units 18 townhouses

Address	Location	Proposed Development
705 Rymal Road East	N side Rymal between Upper Sherman and Eva (Miles)	70 apartment units 95 townhouses
741 Rymal Road East	NW corner Rymal / Eva / Miles	4.57 ksf office 32 apartment units
820 Rymal Road East	SW corner Rymal / Sulmona (e/o Miles)	14 townhouses
385 Nebo Road	SE corner Rymal / Nebo	Commercial plaza including: • A gas bar with drive-through restaurant • Ancillary auto service uses (car wash, quick lube etc.) • 5.4 ksf stand-alone restaurant space • 29.4 ksf retail / service commercial space • 24.1 ksf office space • 15.5 ksf medical clinic • 84.8 ksf building supply store
1324 Rymal Road East	SW corner Rymal / Dartnall	Gas bar with convenience store and car wash A&W restaurant with drive-through (in convenience store)

Note: ksf = 1,000 sq. ft.

Three of the development applications (323 Rymal Road East, 544-550 Rymal Road East; 385 Nebo Road) have submitted traffic studies documenting anticipated traffic volumes generated by the proposed development. The other sites are in more preliminary stages or have not otherwise submitted traffic studies.[2] For the purpose of this assessment, the trip generation forecasts have been carried forward where available, and have been estimated where forecasts have not yet been prepared.

Given the high level of the analyses, pass-by trips were discounted from the overall trip generation forecasts but were not specifically assigned to the road network. (Pass-by trips are made by motorists that are already passing the site and are making a stop along the way at the subject site; these trips are observed on the site driveways but do not represent an increase in traffic on the road network. By comparison, primary trips are new trips made by motorists that would not otherwise be traveling in the area.) This is a reasonable representation of traffic forecasts at a link level but may understate turning movement volumes at some intersections where proposed commercial development is directly adjacent.

Table 19 presents the trip generation and pass-by rates applied to the planned developments in the study area. These rates were obtained from the ITE *Trip Generation Manual* (10th edition) and *Trip Generation Handbook* (3rd edition).

[2] The inclusion of data for these sites does not necessarily indicate the endorsement of City of Hamilton staff or negate any comments that may be provided through the development application process. Similarly, the inclusion of preliminary traffic forecasts for other sites does not obviate the requirement to prepare site-specific transportation studies as part of the development application process.

Table 19: Trip Generation Rates

Type of Development; ITE Land Use Code	AM Peak Hour					PM Peak Hour

Table 20 presents the number of trips generated throughout the study area based on the trip generation rates listed in Table 19.

The directional distribution of development trips was estimated separately for residential, commercial (retail) and employment-based land uses based on data from the 2016 Transportation Tomorrow Survey (TTS). The TTS zones extending from Upper James Street to Dartnall Road, and from the Lincoln Alexander Parkway to south of Rymal Road, were assumed to be a reasonable proxy for future development traffic. Table 21 presents the directional distribution applied to development traffic.

Table 20: Net Trip Generation

Land Use and Magnitude	AM Peak Hour			PM Peak Hour

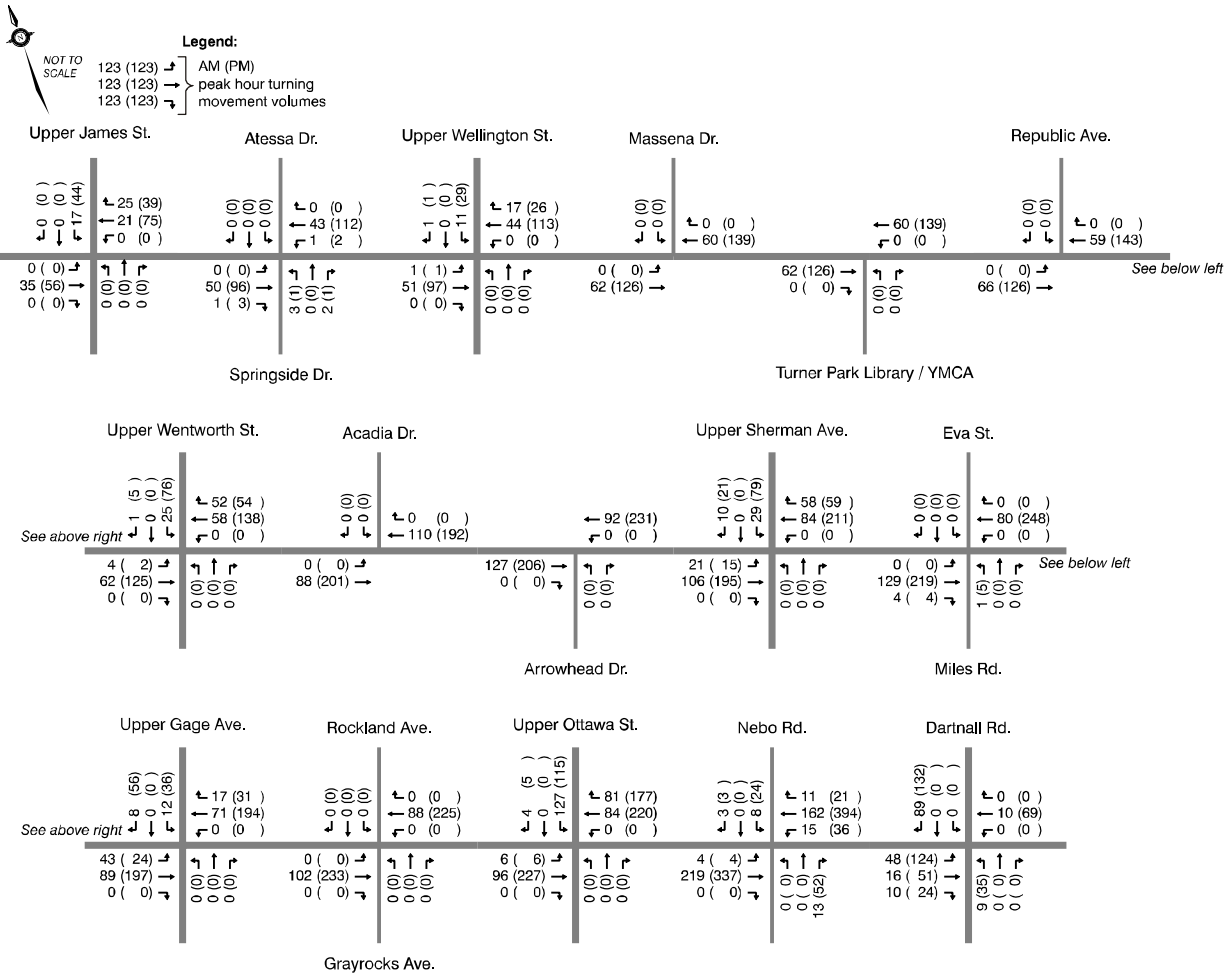
East	10%	5%	0%	8%
Local (within general study area)	16%	0%	0%	15%

(Note: Percentages may not add to 100% due to rounding.)

The trips were then assigned logically to the road network. Longer-distance trips using the Lincoln Alexander Parkway / Red Hill Valley Parkway were assigned to the most logical north-south roadway(s) with interchange access, depending on the location of the development and the relative ease of making right and left turn movements. A similar process was followed for trips destined to the north (both in the lower city and the northern area of the upper city) where appropriate.

Figure 18 presents the volume of traffic estimated to be generated by currently planned developments based on the methodology outlined above.

Figure 18: Projected Development Traffic



5.2 General Background Growth

General background growth is an increase in traffic volumes through the study area that is not directly attributable to any specific new developments. The background growth rate was estimated through a comparison with link traffic volumes forecast by the City's EMME long-range regional transportation model. The model was developed as part of the TMP update and includes the following scenarios (all of which reflect AM peak hour travel demand):

- 2011 existing conditions;
- 2031 "do nothing" conditions (i.e., 2031 travel demand on the 2011 network);
- 2031 "base case" including currently programmed and approved infrastructure modifications;
- 2031 Scenario "A": same as the "base case" but with widening of Highway 403;

- 2031 Scenario "B": same as the "base case" but with a significant increase in non-auto ridership relying in part on the implementation of the BLAST network; also includes a potential roadway linking the Red Hill Valley Parkway and the airport;
- 2031 Scenario "C": same as Scenario "B" but with the widening of the Lincoln Alexander Parkway / Red Hill Valley Parkway to six lanes; and
- 2031 Scenario "D": includes measures in Scenarios "A", "B" and "C" as well as additional modifications at Lincoln Alexander Parkway / Highway 403 and at Red Hill Valley Parkway / QEW.

Given the differences in the network from one scenario to another, the model yields a range of traffic forecasts along the Rymal Road corridor rather than a specific defined demand. In addition, the model is generally calibrated at a coarser screenline level rather than at the link level, and as such the forecasts on individual links may vary from actual conditions (e.g., when comparing the 2011 model scenario against the traffic volumes presented in Figure 6, the model understates traffic volumes in the central part of the corridor).

The growth rate for this assessment was estimated by applying a preliminary growth rate to the existing volumes shown in Figure 6, adding the development traffic volumes shown in Figure 18, and comparing the resulting link volumes against the Scenario "A", "B" and "C" forecasts. The preliminary growth rate was then adjusted to yield link volumes that are broadly consistent with the EMME results, recognizing the range in forecasted volumes and the relatively coarse nature of the model output. Figure 19 presents the estimated 2031 link volumes on Rymal Road assuming an annual growth rate of 1% eastbound / 2% westbound, and compares them against the forecasts from Scenarios "A" through "C".

For PM peak hour forecasts, the growth rates were reversed (1% westbound and northbound; 2% eastbound and southbound).

Figure 19: Comparison of Estimated Traffic Volumes and Model Projections (Rymal Road)

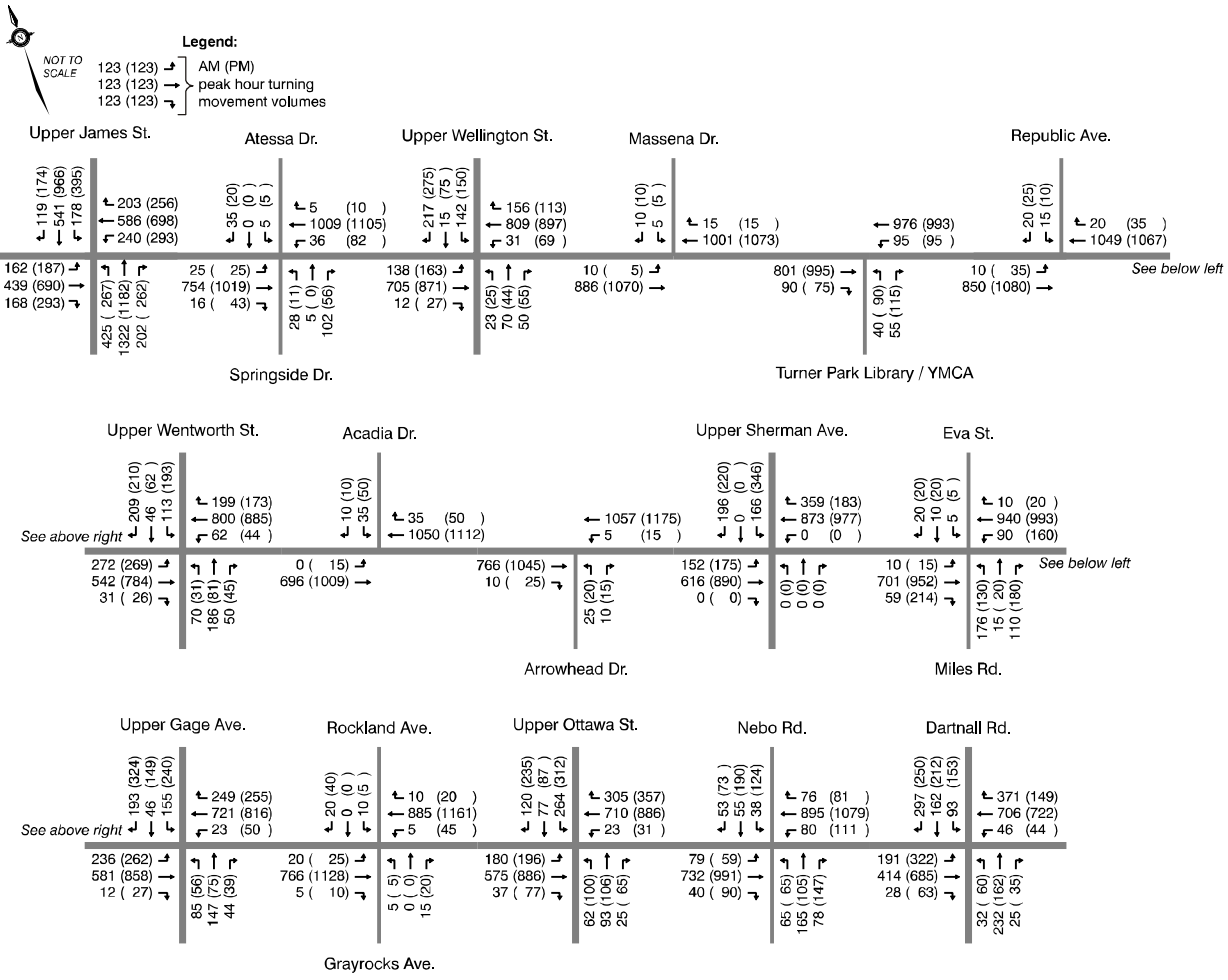
6 = Dartnall

5.3 2041 Traffic Projections

Figure 20 presents the estimated 2041 traffic volumes applied in the traffic analyses. These volumes account for the development traffic documented in Section 5.1 and the traffic growth rates documented in Section 5.2 (extrapolated an additional 10 years to 2041).

Figure 20: Estimated 2041 Traffic Volumes



6.0 Assessment of Future Conditions

6.1 Future "Do Nothing" Intersection Operations

Intersection operational analyses were completed under the projected future volumes using Trafficware's Synchro software (version 10). At signalized intersections, the volume-to-capacity (v/c) ratio, average vehicular delay, level of service and 95th percentile queue were noted for each individual movement, and the average delay and level of service were noted for the intersection as a whole. At unsignalized (stop-controlled) intersections, the v/c ratio, delay, level of service and 95th percentile queue were noted for any stop-controlled movements. Synchro reports are provided in Appendix C.

The 2019 lane configuration and intersection geometry was applied, with the following exceptions:

- Eastbound and westbound right turn lanes have subsequently been constructed at Upper Sherman Avenue and have been included in the analyses; and
- Planned road construction on Nebo Road south of Rymal Road will result in the addition of a northbound right turn lane at the intersection with Rymal Road, which has been included in the analyses.

Under the projected 2041 volumes, the majority of signalized intersections with major arterials are expected to operate at LOS C to D overall. The intersections with Upper James Street and with Upper Sherman Avenue are expected to operate at LOS F during both peak hours, and the intersections with Miles Road / Eva Street and with Upper Ottawa Street are expected to operate at LOS F during the PM peak hour.

The capacity of the roadway to accommodate the projected volumes was assessed by comparing the anticipated v/c ratios against critical thresholds typically applied by the City in evaluating intersection operations. A v/c ratio of 0.85 or higher on through lanes, or 1.00 or higher on dedicated left turn lanes, is typically an indication that mitigation is recommended. The majority of intersections are expected to experience capacity constraints on one or more movement during the AM and/or PM peak hours:

- Upper James Street
  - Eastbound through (PM)
  - Westbound left (PM)
  - Northbound left (AM)
  - Northbound through (AM/PM)
  - Southbound left (PM)
  - Southbound through (PM)
- Upper Wellington Street
  - Westbound through (AM/PM)
  - Southbound through (PM)
- Upper Wentworth Street
  - Eastbound left (AM/PM)
  - Westbound through (AM/PM)
- Upper Sherman Avenue
  - Eastbound left (AM/PM)
  - Westbound through (AM/PM)
- Miles Road / Eva Street:
  - Eastbound through (PM)
  - Westbound through (AM/PM)
  - Northbound approach (AM/PM)
- Upper Ottawa Street:
  - Eastbound through (PM)
  - Westbound through (PM)
  - Southbound left (AM/PM)
- Nebo Road:
  - Eastbound through (PM)
  - Westbound through (PM)
  - Westbound left (PM)

In some cases, the capacity constraint can be mitigated by minor timing adjustments (e.g., the westbound through movement at Dartnall Road, which is projected to only marginally exceed the critical threshold during the PM peak hour). However, in most cases the anticipated capacity constraints are too great to address through minor adjustments alone, or adjustments to mitigate the constraints would result in critical conditions on other movements.

Table 23: 2041 Unsignalized Intersection Operations, Baseline Configuration

Rymal Road at:	Movement	AM Peak Hour				PM Peak Hour			
		V/C	LOS	Delay *(s/veh)*	95th %ile Queue *(m)*	V/C	LOS	Delay *(s/veh)*	95th %ile Queue *(m)*
Massena Drive	SB approach	0.04	D	25.4	1	0.05	D	26.3	1
Republic Avenue	SB left SB right	0.17 0.11	F C	50.5 24.8	5 3	0.08 0.12	D C	34.7 23.4	2 3
Arcadia Drive	SB left SB right	0.73 0.05	F C	174 21.7	24 1	5.00 0.04	F C	>200 21.2	>39 1

Growth on Rymal Road is anticipated to result in LOS F conditions on most stop-controlled intersections included in the assessment. The Republic Avenue stop-controlled approach is expected to have sufficient capacity, and the poor level of service is based on increased side street delays. The Acadia Drive and Arrowhead Drive intersections are expected to exceed capacity during one or both peak hours. While not all unsignalized intersections and driveways were included in the analyses, conditions at the intersections shown in Table 23 suggest that most stop-controlled accesses and driveways are likely to experience poor levels of service and/or capacity constraints due to increased east-west travel in a two-lane cross-section.

6.2 Potential Future Road Configuration

The capacity and operational deficiencies identified in Section 6.1 indicate that additional roadway capacity will be required along Rymal Road to accommodate anticipated growth in east-west traffic. The magnitude and extent of the constraints indicate that traffic signal timing modifications and/or isolated intersection modifications would not be sufficient to address the problem, and as a result the widening of Rymal Road to a five-lane cross-section (two lanes per direction plus a centre two-way left turn lane) is recommended. Widening of Rymal Road to five lanes would also result in a consistent cross-section along the corridor, matching the existing cross-section west of Springside Drive and east of Dartnall Road.

The projected 2041 traffic volumes were re-assessed assuming a five-lane cross-section along Rymal Road. Intersection operations were first tested assuming dedicated eastbound and westbound left turn lanes, no dedicated eastbound or westbound right turn lanes, and the existing lane configuration on north/south roadways. The opportunity to reduce the corridor cycle length from 120 seconds was reviewed, recognizing that the additional east-west capacity may reduce the need for long cycle lengths to maximize intersection capacity; shorter cycle lengths would allow for shorter delays and queues for vehicular traffic, as well as shorter delays for pedestrians waiting to cross Rymal Road.

Potential changes to north-south pedestrian clearance intervals were estimated, given that intersection designs had not been prepared at the time of the analyses.

Table 24 presents the results of the signalized intersection analyses. Synchro reports are provided in Appendix D.

With Rymal Road widened to a five-lane cross-section, the majority of signalized intersections east of Upper James Street and west of Dartnall Road are anticipated to operate at LOS A to B, and with all movements operating at reasonable v/c levels. The main exception is the intersection with Upper Ottawa Street, which is anticipated to operate at LOS C to D, and with continued capacity constraints on the westbound approach and the southbound left turn. This can be addressed by adding a westbound right turn lane to the basic five-lane cross-section at this intersection.

At Upper James Street, Rymal Road already has a five-lane cross-section (including left turn lanes) and therefore the modifications in the section to the east would not affect intersection operations; a number of movements would continue to operate at or above capacity. Other modifications at Upper James Street are discussed in Section 6.3.

As further mitigation, consideration was also given to the potential effects of extending Upper Sherman Avenue southerly to Miles Road, to eliminate the need for north-south traffic traveling along the Upper Sherman Avenue / Miles Road corridor to travel along Rymal Road. The results of this diversion scenario for these two intersections are presented in Table 25.

The diversion of traffic would result in moderately increased delays at Upper Sherman Avenue due to the increase in traffic on minor movements, but would improve operations at Miles Road and Eva Street due to diversion of traffic to Upper Sherman Avenue. It would also reduce travel times for north-south travel through these intersections by eliminating the need to travel along Rymal Road. As such, the Upper Sherman Avenue southerly extension is not necessary in addition to the widening of Rymal Road to five lanes, but would have other operational benefits that suggest it be considered as a separate initiative.

Table 26 presents the results of the unsignalized intersection analyses.

Table 26: 2041 Unsignalized Intersection Operations, Five-Lane Cross-Section

The additional east-west lanes on Rymal Road are anticipated to improve conditions on the unsignalized intersections included in the study area. Most are anticipated to operate at better than LOS F, and all are anticipated to operate within capacity.

6.3 Intersection Alternatives at Upper James Street

The analysis results at Upper James Street and Rymal Road as outlined in the foregoing sections are based on a "do nothing" configuration at that intersection.

The City is considering alternatives to provide queue jump lanes on Upper James Street as part of the work for the A-Line. A design concept previously developed in 2017 included the addition of a northbound right turn lane on Upper James Street in addition to separate northbound and southbound bus queue jump lanes; channelized right turn movements were proposed to ensure that right-turning vehicles would not queue back into the bus lane.

As part of the functional design work on Rymal Road, an additional concept was developed to mitigate traffic conditions and/or improve conditions for transit service on Rymal Road. In addition to the northbound/southbound right turn lanes and separate queue jump lanes, eastbound and westbound right turn lanes were added on Rymal Road, to also serve as bus queue jump lanes leading to far-side stops. This configuration was tested under the projected 2041 volumes; the results are presented in Table 27.

Table 27: 2041 Intersection Operations at Upper James Street; Revised Configuration

Movement	AM Peak Hour				PM Peak Hour			
	V/C	LOS	Delay *(s/veh)*	95th %ile Queue *(m)*	V/C	LOS	Delay *(s/veh)*	95th %ile Queue *(m)*

WB left	0.83	D	53.3	80	1.03	F	84.6	104
WB through	0.72	D	43.7	86	0.65	D	37.3	95
WB right	0.43	B	11.7	28	0.40	A	5.5	13
NB left	0.81	C	27.4	83	1.02	F	94.3	102
NB through	0.88	D	35.5	176	0.94	E	61.6	156
NB right	0.28	A	4.4	15	0.44	A	8.7	27
SB left	1.03	F	103.0	74	1.01	F	81.9	149
SB through	0.44	C	27.9	66	0.86	D	44.3	159
SB right	0.19	A	5.0	12	0.29	B	12.0	28
Overall	—	C	34.7	—	—	D	47.2	—

The revised intersection configuration would improve the level of service to LOS C to D. The southbound, northbound and westbound left turn movements would be at or slightly above capacity during the AM and/or PM peak hours, and the northbound through movement would be approaching capacity. Additional capacity could be provided by adding dual left turn lanes on one or more approaches; however, this would result in increased pedestrian crossing distance at an already large intersection where transfer activity can be expected between the A-Line and S-Line corridors. Dual left turn lanes also reduce flexibility in signal operations during off-peak times, since they require fully protected left turn phases to be provided at all times. As such, dual left turn lanes are not recommended.

6.4 Multi-Modal Infrastructure Requirements

In addition to the traffic capacity and operational constraints identified in Section 6.1, the following existing missing links and future opportunities were identified to accommodate multi-modal travel along Rymal Road.

6.4.1 Pedestrian Movement

Although there are sidewalks along both sides of most of the corridor, there are gaps in the sidewalk network:

- A 100-metre gap on the north side, west of Atessa Drive;
- A 300-metre gap between Upper Sherman Avenue and Miles Road (both sides);
- A 125-metre gap on the south side, east of Upper Ottawa Street; and
- The majority of the link between Nebo Road and Dartnall Road.

New sidewalk construction, and sidewalk reconstruction that may be required to accommodate roadway widening, should reference the design toolbox provided in the Hamilton Pedestrian Mobility Plan.

6.4.2 Cycling Connectivity

There is currently no dedicated cycling infrastructure along Rymal Road within the study area. The Cycling Master Plan identifies a future off-street multi-use trail from Upper Sherman Avenue westerly to beyond the western study area limits. Although the Cycling Master Plan does not identify cycling infrastructure east of Upper Sherman Avenue, consideration could be given to extending a multi-use trail farther to the east (e.g., to the Chippawa Rail Trail between Nebo Road and Dartnall Road, or to the existing multi-use path at Pritchard Road 850 metres east of the study area).

Ultimately, two north-south off-street multi-use trails are envisioned to cross Rymal Road in the study area. One is the existing Chippawa Rail Trail between Nebo Road and Dartnall Road; and the second is the proposed multi-use trail within the hydro corridor between Upper Wentworth Street and Upper Sherman Avenue. Opportunities should be resolved to accommodate cyclists and pedestrians wishing to cross Rymal Road at these locations.

6.4.3 Transit

The "S" line of the planned BLAST rapid transit network follows Rymal Road through the study area. Current HSR plans are to operate parallel local and limited-stop service along Rymal Road, with the express service stopping at all north-south arterials. Service on the limited-stop route is planned to operate at 10-minute headways (or less) during the weekday peak periods.

As outlined in Section 4.3.4, a set of ridership forecasts was prepared and documented under separate cover; these forecasts were used to determine the appropriate type of service and transit priority measures along the entire S-Line corridor. This evaluation found the following:

- On the basis of ridership, the 2051 forecasts would warrant isolated transit priority measures within the majority of the S-Line corridor, but not a dedicated exclusive facility.
- On the basis of bus headways, the number of buses per hour would not warrant transit priority through the majority of the S-Line corridor. The section between Upper James Street and Dartnall Road was identified as an exception, with transit priority measures being nearly justified. This

section is different because it includes two segments (between Upper Wellington Street and Upper Wentworth Street; between Upper Sherman Avenue and Upper Gage Avenue) where north-south routes travel along Rymal Road as part of an end-of-line loop. (The north-south routes have subsequently been proposed to be modified as part of the HSR's "rail ready" reconfiguration but would still result in sections where north-south routes operate along part of Rymal Road, between Upper James Street and Upper Wellington Street, and between Upper Wentworth Street and Upper Gage Avenue.)

Conceptual design work being undertaken as part of this EA is considering the need and opportunity for queue jump lanes at intersections along Rymal Road and the relationship with major stop locations (near-side vs. far-side stops). When the roadway designs are developed in greater detail in the future, they should consider the provision of additional passenger amenities (e.g., shelters, real-time arrival information displays) at transfer points, major intersections and other higher-ridership stops.

6.4.4 Trucks

Rymal Road forms part of the truck route network. While no specific infrastructure is warranted, roadway geometry should accommodate the movement of larger trucks (particularly corner radii where other north-south truck routes intersect with Rymal Road).

Corner radii that are designed to accommodate truck movements can result in poorer conditions for pedestrians, in that they increase the crossing distance and exposure time for pedestrians crossing the intersection, and enable higher speeds for smaller vehicles completing right turns. At the detailed design stage, truck right turn paths should be tested at intersections between truck routes to identify the minimum radius that will reasonably accommodate truck movements.

7.0 Summary

Rymal Road is the southernmost east-west arterial road within the Hamilton urban limits, approximately 2 kilometres south of the Lincoln Alexander Parkway. It forms a continuous link across the city, from Ancaster to the boundary with Niagara Region.

In the past five years, sections of Rymal Road west of Upper James Street and east of Dartnall Road have been widened to a four- to five-lane cross-section with continuous active transportation features. A 4.7-kilometre section of Rymal Road, extending from Springside Avenue (east of Upper James Street) to Dartnall Road, still has a three-lane cross-section (one lane per direction plus a continuous two-way left turn lane) and has gaps in the sidewalk network. The closest east-west cycling infrastructure is bicycle lanes on Stone Church Road, 1 kilometre to the north.

Five years of collision reports were reviewed covering the years 2015 through 2019 inclusive. Rear-end collisions are the most prevalent type along the corridor; widening from a three-lane to a five-lane cross-section may help to mitigate this pattern (reduced queue lengths; reduced friction at unsignalized right turns), although this may be offset by other factors (potential for increased sideswipe collisions; potential for higher midblock speeds and higher turning speeds at intersections; longer pedestrian crossing distances).

The number of collisions involving pedestrians or cyclists was low on an absolute basis, although this is offset by the low level of existing cycling activity within the corridor. There are currently no dedicated bicycle facilities in the corridor. A bicycle facility would provide an improved sense of security for cyclists, although a two-way cycling facility would likely not have addressed the reported collisions; all were angle collisions and most involved right-turning motorists and cyclists approaching from the right (i.e., in the contraflow direction), which would be reinforced with a two-way cycling facility.

Traffic forecasts have been prepared for a 2041 horizon. The forecasts account for currently anticipated development along the corridor, plus a growth rate of 1% to 2% per year. Under the 2041 traffic forecasts, several intersections along the corridor are anticipated to experience congestion and poor levels of service on one or more movements. The magnitude and nature of the capacity constraints are such that low-impact mitigation (signal timing adjustments; isolated intersection modifications) are unlikely to address them. Further, since the constraints extend broadly across the corridor, a considerable proportion of the corridor would require modifications even under an “isolated modifications” scenario.

Widening Rymal Road to a five-lane cross-section would address the anticipated capacity requirements through the majority of the study area and would provide flexibility for further growth. In addition to the five-lane cross-section, a westbound right turn lane is recommended at Upper Ottawa Street. Dedicated right turn lanes are recommended in all directions at Upper James Street. On Rymal Road these would also serve as queue jump lanes; on Upper James Street they would be in addition to separate queue jump lanes, both of which are carried over from a previously proposed concept.

Consideration should be given to carrying the planned Upper Sherman Avenue extension southerly into the rural area and connecting it to Miles Road to eliminate the jog along Rymal Road; although this is not required to accommodate the 2041 volumes, it would improve operations at Rymal Road and Miles Road, and would reduce delays for vehicles traveling along the Miles Road / Upper Sherman Avenue corridor.

Any construction on Rymal Road should include sidewalk construction to fill in existing gaps in the sidewalk network (west of Atessa Drive; between Upper Sherman Avenue and Miles Road; east of Upper Ottawa Street; east of Nebo Road). Sidewalk design should reference the design toolbox provided in the Hamilton Pedestrian Mobility Plan.

The Cycling Master Plan recommended an off-street multi-use pathway along Rymal Road from Upper Sherman Avenue westerly to beyond the study area limits. Road modification plans should accommodate cycling infrastructure in this segment (e.g., a bicycle-only path or multi-use trail), and should consider the feasibility of extending it east of Upper Sherman Avenue for connectivity to other cycling infrastructure (e.g., to the Chippawa Rail Trail between Nebo Road and Dartnall Road or to the existing multi-use path at Pritchard Road 850 metres east of the study area).

Rymal Road forms part of the "S" line, a crosstown route extending along Rymal Road and Centennial Parkway in the City's "BLAST" rapid transit plan. The HSR proposes to operate parallel local and limited-stop services along Rymal Road as part of a network restructuring to be implemented when the LRT opens, as well as reconfiguring some routes that intersect with the corridor; service levels on the express service are proposed to be increased to at least 10-minute headways during peak periods. Long-term ridership forecasts along Rymal Road are below levels where full continuous, exclusive facilities are warranted, although high enough to consider isolated transit priority measures (e.g., transit signal priority and/or physical intersection measures such as queue jump lanes). In addition, passenger amenities at S-Line stops (shelters, "next bus" displays, etc.) should be considered as part of the detailed design.

Rymal Road is a designated truck route, as are other several other north-south roadways that intersect with Rymal Road. While no specific infrastructure is required along Rymal Road to accommodate trucks, corner radii at intersecting truck routes should be designed to accommodate truck turns. To balance truck requirements against pedestrian crossing considerations, truck turning paths should be tested at the detailed design stage to identify the minimum corner radii that will reasonably accommodate truck movements.

Mike Walters, P.Eng.

Appendix A

Level of Service Definitions

LEVEL OF SERVICE[1]

Level of Service (LOS) is defined as a qualitative measure describing operational conditions within a traffic stream, and their perception by motorists and/or passengers. This concept was introduced in the 1965 *Highway Capacity Manual* as a criteria for interrupted flow conditions. The 2000 *Highway Capacity Manual* changed the basis for measuring Level of Service at intersections to control delay[2].

Six Levels of Service are defined with LOS A representing the best operating conditions, and LOS F the worst (briefly described below). It should be noted that there is often significant variability in the amount of delay experienced by individual drivers.

LOS A: This Level of Service describes the highest quality of traffic flow and is referred to as free flow. The approach appears open, turning movements are easily made and drivers have freedom of operation. Control delay is less than 10 seconds/vehicle.

LOS B: This Level of Service is referred to as a stable flow. Drivers feel somewhat restricted and occasionally may have to wait to complete the minor movement. Control delay is 10-15 seconds/vehicle for unsignalized intersections and 10-20 seconds/vehicle for signalized intersections.

LOS C: At this level, the operation is stable. Drivers feel more restricted and may have to wait, with queues developing for short periods. Control delay is 15-25 seconds/vehicle at unsignalized intersections and 20-35 seconds/vehicle at signalized intersections.

LOS D: At this level, traffic is approaching unstable flow. The motorist experiences increasing restriction and instability of flow. There are substantial delays to approaching vehicles during short peaks within the peak period, but there are enough gaps to lower demand to permit occasional clearance of developing queues and prevent excessive back-ups. Control delay is 25-35 seconds/vehicle at unsignalized intersections and 35-55 seconds/vehicle at signalized intersections.

LOS E: At this level capacity occurs. Long queues of vehicles exist and delays to vehicles may extend. Control delay is 35-50 seconds/vehicle at unsignalized intersections and 55-80 seconds/vehicle at signalized intersections.

LOS F: At this Level of Service, the intersection has failed. Capacity of the intersection has been exceeded. Control delay exceeds 50 seconds/vehicle at unsignalized intersections and exceeds 80 seconds/vehicle at signalized intersections.

---

[1] *Transportation Research Board: Highway Capacity Manual 1965, 2000*

[2] *Control delay is defined as the component of delay that results when a control signal causes a lane group to reduce speed or to stop; it is measured by comparison with the uncontrolled condition.*

Intersection Summary			
Area Type:	Other		
Cycle Length: 120			
Actuated Cycle Length: 120			
Offset: 11 (9%), Referenced to phase 2:EBTL and 6:WBTL, Start of Green			
Natural Cycle: 100			
Control Type: Actuated-Coordinated			
Maximum v/c Ratio: 1.04			
Intersection Signal Delay: 39.1		Intersection LOS: D	
Intersection Capacity Utilization 91.9%		ICU Level of Service F	
Analysis Period (min) 15			
~ Volume exceeds capacity, queue is theoretically infinite.			
Queue shown is maximum after two cycles.			
# 95th percentile volume exceeds capacity, queue may be longer.			
Queue shown is maximum after two cycles.			
m Volume for 95th percentile queue is metered by upstream signal.			

Splits and Phases: 131: Miles Rd./Eva St. & Rymal Rd.

Intersection Summary

Area Type: Other
Cycle Length: 120
Actuated Cycle Length: 120
Offset: 116 (97%), Referenced to phase 2:EBTL and 6:WBTL, Start of Green
Natural Cycle: 100
Control Type: Actuated-Coordinated
Maximum v/c Ratio: 0.76
Intersection Signal Delay: 30.8 Intersection LOS: C
Intersection Capacity Utilization 101.8% ICU Level of Service G
Analysis Period (min) 15
* User Entered Value
\# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 150: Upper Ottawa St. & Rymal Rd.

Intersection Summary

Area Type: Other
Cycle Length: 120
Actuated Cycle Length: 120
Offset: 116 (97%), Referenced to phase 2:EBTL and 6:WBTL, Start of Green
Natural Cycle: 90
Control Type: Actuated-Coordinated
Maximum v/c Ratio: 1.13
Intersection Signal Delay: 41.4 Intersection LOS: D
Intersection Capacity Utilization 100.8% ICU Level of Service G
Analysis Period (min) 15

* User Entered Value
~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.
95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 150: Upper Ottawa St. & Rymal Rd.
